

The CERN OpenStack Cloud

Compute Resource Provisioning for the
Large Hadron Collider

Jan van Eldik
for the CERN Cloud Team

OpenStack Days Nordic
Stockholm
September 22, 2016

Agenda

- **Introduction to CERN**
- **Computing at CERN scale**
- **Cloud Service Overview**
- **Operations**
- **Performance**
- **Outlook**

CERN: home.cern

- **European Organization for Nuclear Research** (*Conseil Européen pour la Recherche Nucléaire*)

- Founded in 1954, today 22 member states
- World's largest particle physics laboratory
- Located at Franco-Swiss border near Geneva
- ~2'300 staff members, >12'500 users
- Budget: ~1000 MCHF (2016)

- **CERN's mission**

- Answer fundamental questions of the universe
- Advance the technology frontiers
- Train the scientists and engineers of tomorrow
- Bring nations together

The Large Hadron Collider (LHC)

Largest machine on earth: 27km circumference

LHC: 9'600 Magnets for Beam Control

1232 superconducting dipoles for bending: 14m, 35t, 8.3T, 12kA

LHC: Coldest Temperature

World's largest cryogenic system: colder than outer space (1.9K/2.7K), 120t of He

LHC: Highest Vacuum

Vacuum system: 104 km of pipes, 10^{-10} - 10^{-11} mbar (comparable to the moon)

LHC: Detectors

Four main experiments to study the fundamental properties of the universe

~ 300.000 MB/s
from all sub-detectors

~ 300MB/s
Raw Data

Trigger and data acquisition

Event filter computer farm

Tier 0 at CERN: Acquisition, First pass reconstruction, Storage & Distribution

Solution: the Grid

- Use the Grid to unite computing resources of particle physics institutes around the world

The **World Wide Web** provides seamless access to information that is stored in many millions of different geographical locations

The **Grid** is an infrastructure that provides seamless access to computing power and data storage capacity distributed over the globe

LHC: World-wide Computing Grid

TIER-0 (CERN):
data recording,
reconstruction and
distribution

TIER-1:
permanent storage,
re-processing,
analysis

TIER-2:
simulation,
end-user analysis

nearly 170 sites,
40 countries

~350'000 cores

500 PB of storage

> 2 million jobs/day

10-100 Gb links

LHC: Data & Compute Growth

Collisions produce ~1 PB/s

What we can afford

2012: Enter the cloud

- Aim: virtualize all the machines
 - Unless really, really, really not possible
- Offer Cloud endpoints to users
- Scale horizontally
- Consolidate server provisioning
 - Yes, use the private cloud for server consolidation usecases as well

OpenStack at CERN

Total Cores in OpenStack Clouds at CERN

In production:

- 4 clouds
- >200K cores
- >8,000 hypervisors

90% of CERN's compute resources are now delivered on top of OpenStack

Cloud Service Context

- CERN IT to enable the laboratory to fulfill its mission
 - Main data center on the Geneva site
 - Wigner data center, Budapest, 23ms distance
 - Connected via two dedicated 100Gbs links
- CERN Cloud Service one of the three major components in IT's AI project
 - Policy: Servers in CERN IT shall be virtual
- Based on OpenStack
 - Production service since July 2013
 - Performed 4 rolling upgrades since
 - Currently in transition from Liberty to **Mitaka**
 - Nova, **Glance**, **Keystone**, Horizon, **Cinder**, Ceilometer, **Heat**, Neutron, **Magnum**, **Barbican**

<http://goo.gl/maps/K5SoG>

LIBERTY
THE TWELFTH RELEASE OF OPENSTACK 12

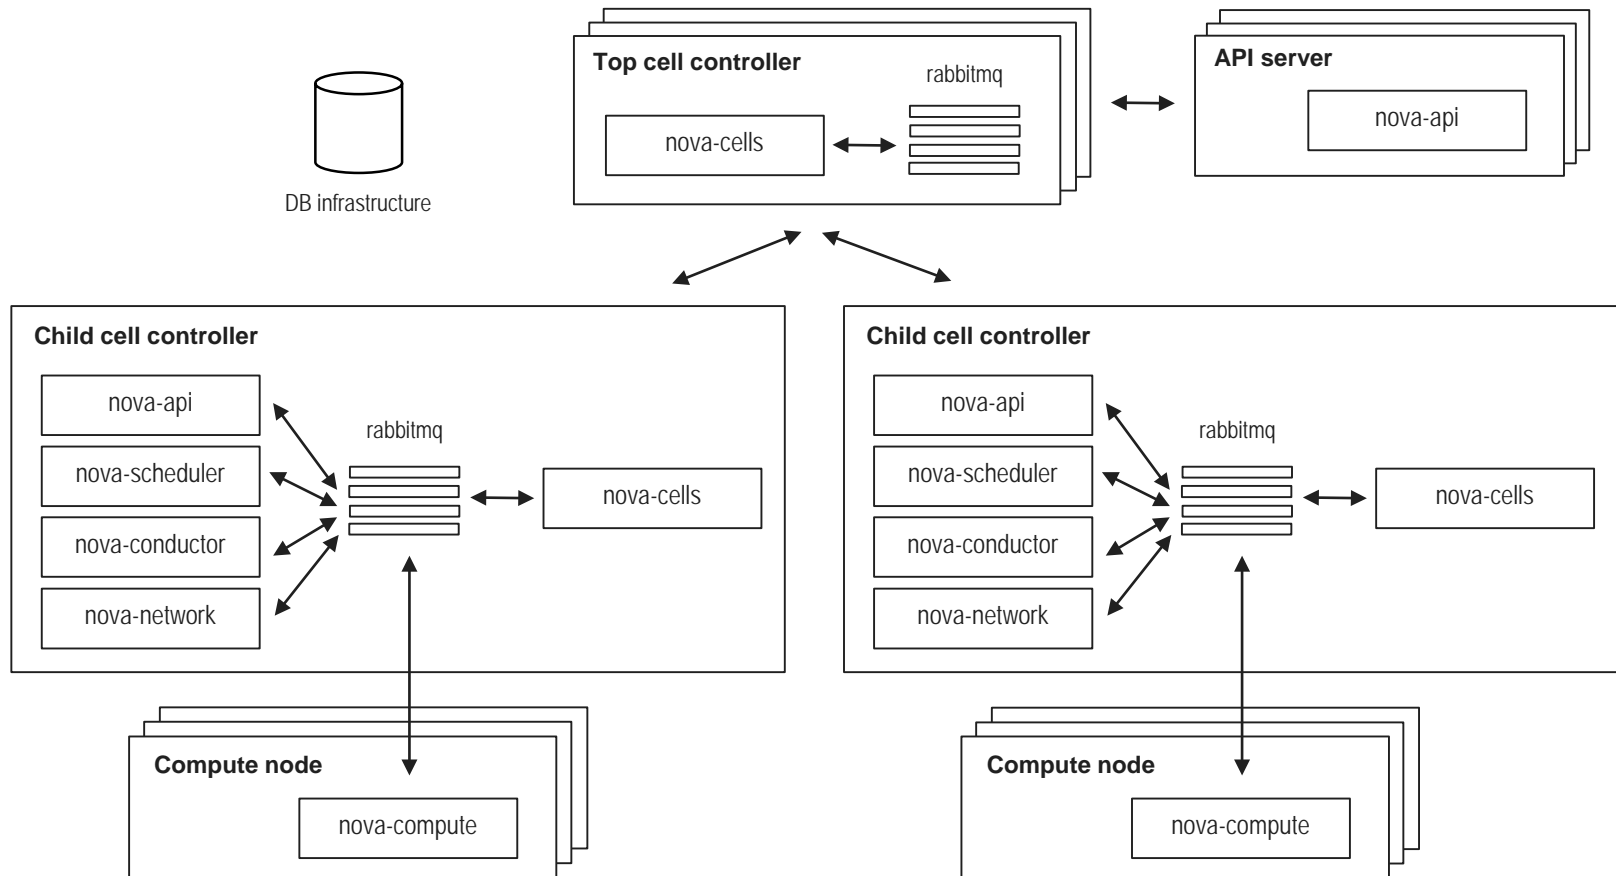

OPENSTACK
mitaka 13

CERN Cloud Architecture (1)

- Deployment spans our two data centers
 - 1 region (to have 1 API), ~40 cells
 - Cells map use cases
hardware, hypervisor type, location, users, ...
- Top cell on physical and virtual nodes in HA
 - Clustered RabbitMQ with mirrored queues
 - API servers are VMs in various child cells
- Child cell controllers are OpenStack VMs
 - **One** controller per cell
 - Tradeoff between complexity and failure impact

CERN Cloud Architecture (2)

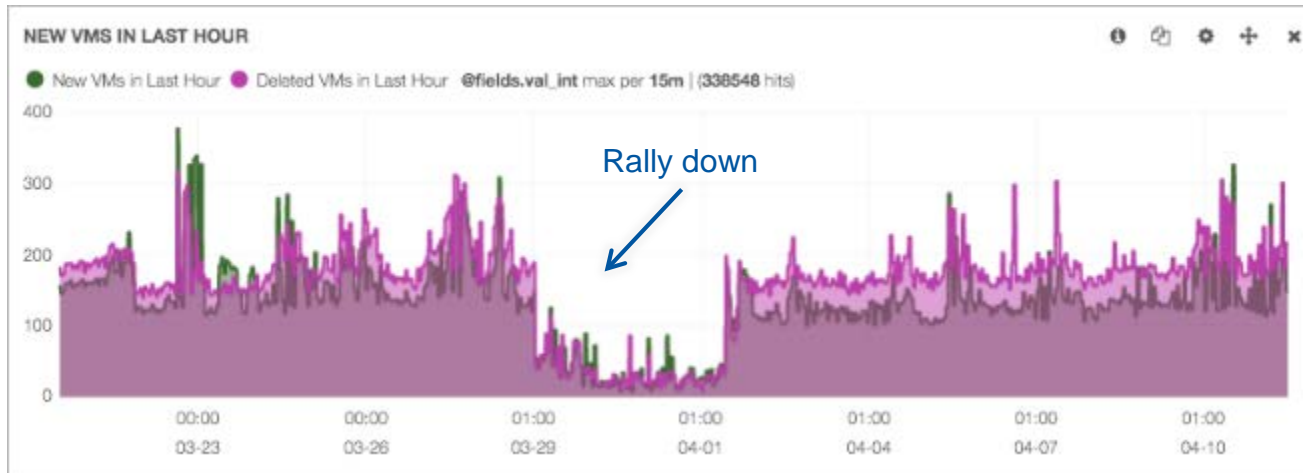

CERN Cloud in Numbers (1)

- ~6700 hypervisors in production
 - Split over 40+ Nova cells
 - Vast majority qemu/kvm now on CERN CentOS 7 (~150 Hyper-V hosts)
 - ~2'100 HVs at Wigner in Hungary (batch, compute, services)
 - 370 HVs on critical power
- 190k Cores
- ~430 TB RAM
- ~20'000 VMs
- Big increase during 2016!
 - +57k cores in spring
 - +40k cores in autumn

CERN Cloud in Numbers (2)

Every 10s a VM gets created or deleted in our cloud!

- 2'700 images/snapshots
 - Glance on Ceph
- 2'300 volumes
 - Cinder on Ceph (& NetApp) in GVA & Wigner

ceph

Only issue during
2 years in prod:
Ceph Issue 6480

Software Deployment

- Deployment based on CentOS and RDO

- Upstream, only patched where necessary (e.g. nova/neutron for CERN networks)
- Some few customizations
- Works well for us

- Puppet for config' management

- Introduced with the adoption of AI paradigm

- We submit upstream whenever possible

- openstack, openstack-puppet, RDO, ...

- Updates done service-by-service over several months

- Running services on dedicated (virtual) servers helps (Exception: ceilometer and nova on compute nodes)

- Upgrade testing done with packstack and devstack

- Depends on service: from simple DB upgrades to full shadow installations

'dev' environment

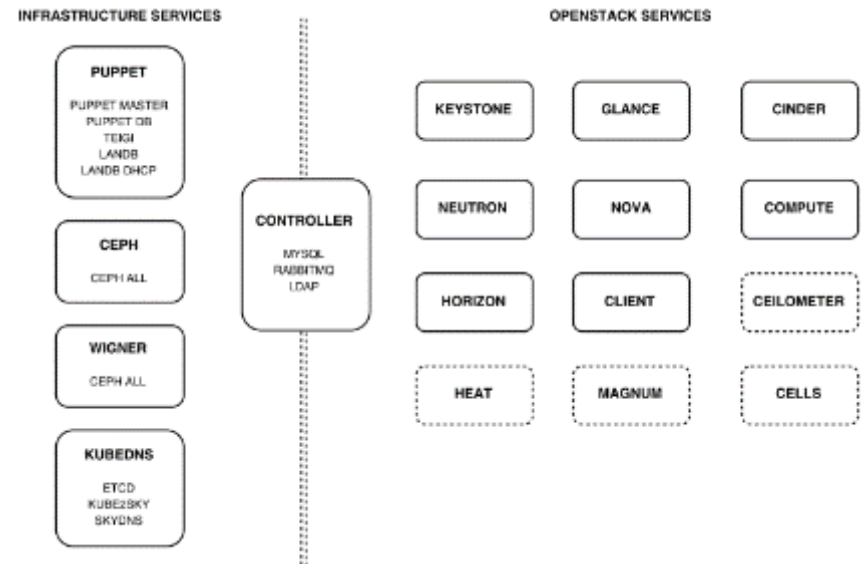

- Simulate the full CERN cloud environment on your laptop, even offline
- Docker containers in a Kubernetes cluster
 - Clone of central Puppet configuration
 - Mock-up of
 - our two Ceph clusters
 - our secret store
 - our network DB & DHCP
 - Central DB & Rabbit instances
 - One POD per service
- Change & test in seconds
- Full upgrade testing

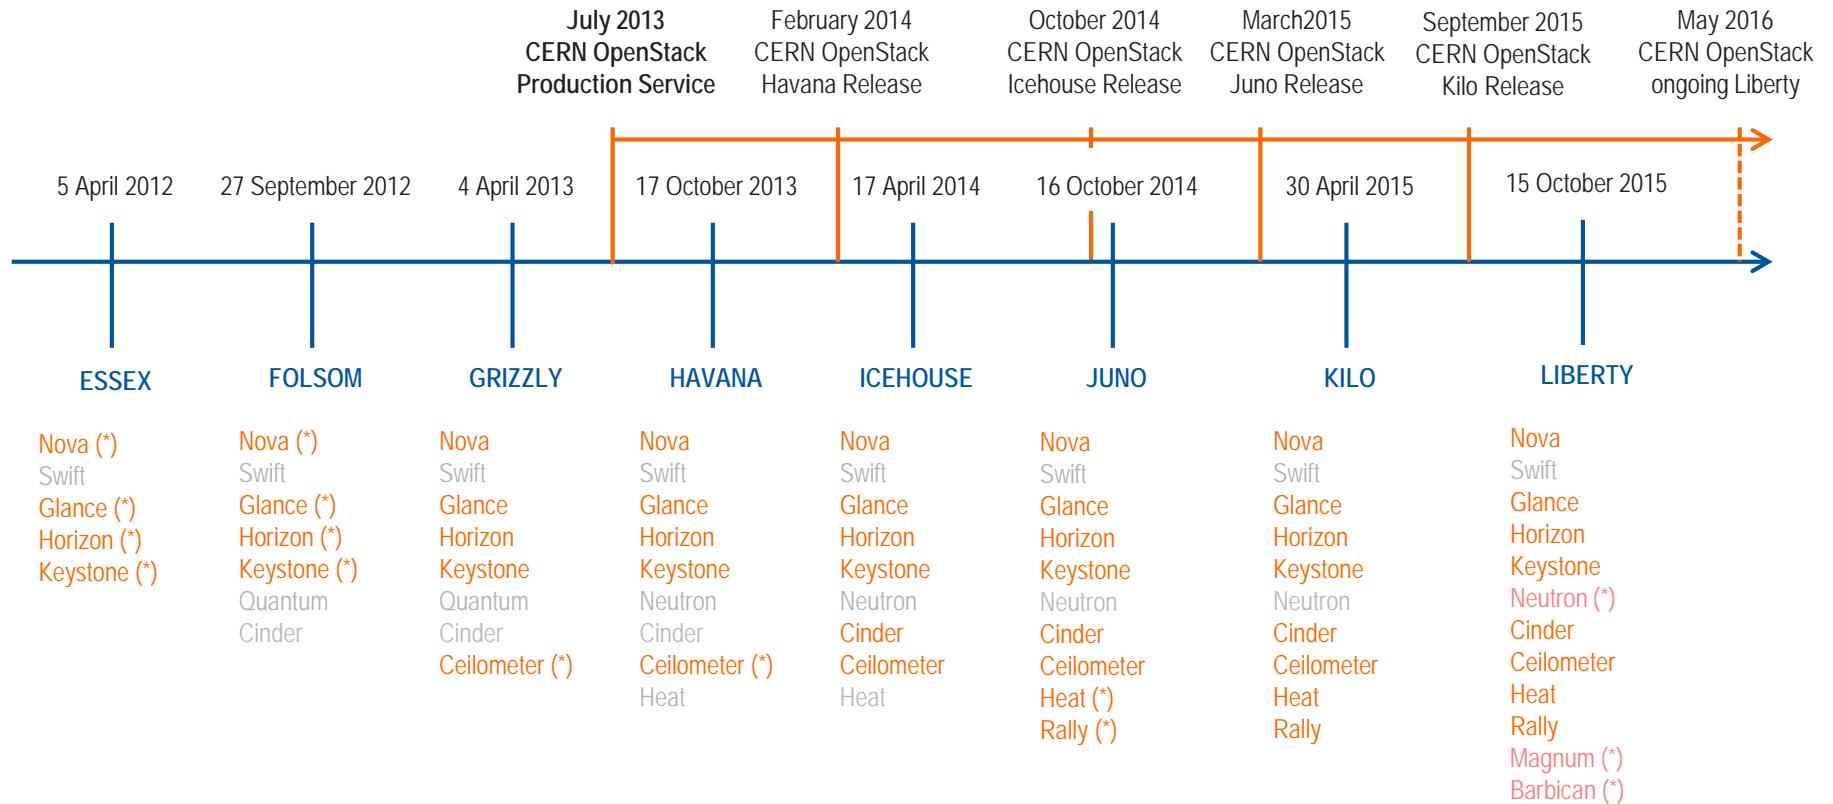

kubernetes

docker

Cloud Service Release Evolution

(*) Pilot

Rich Usage Spectrum ...

- **Batch service**
 - Physics data analysis
- **IT Services**
 - Sometimes built on top of other virtualised services
- **Experiment services**
 - E.g. build machines
- **Engineering services**
 - E.g. micro-electronics/chip design
- **Infrastructure services**
 - E.g. hostel booking, car rental, ...
- **Personal VMs**
 - Development

GitLab

OPENSIFT

elastic

openstack

RUNDECK

CouchDB

RabbitMQ

... rich requirement spectrum!

Usecases (1)

Server consolidation:

- Service nodes, dev boxes, Personal VMs, ...
- Performance less important than “durability”
- Live-migration is desirable
- Persistent block storage is required
- Linux VM @ KVM, Windows VMs @ HyperV
- Starting to run Win VMs under KVM
- “Pets usecase”: 32K cores, 7500 VMs

Usecases (2)

- Compute workloads
 - Optimize for compute efficiency
 - CPU passthrough, NUMA aware flavours
 - Still, very different workloads
 - IT Batch: LSF and HTCondor, longlived VMs, 8 and 16-core VMs, “full-node” flavors
 - CMS Tier-0: medium-long, 8-core VMs
 - LHCb Vcycle: short-lived, single core VMs
 - Low-SLA, “cattle usecase”
 - 150K cores, 12500 VMs @ 6000 compute nodes

Wide Hardware Spectrum

- The ~6700 hypervisors differ in ...
 - Processor architectures: AMD vs. Intel (av. features, NUMA, ...)
 - Core-to-RAM ratio (1:2, 1:4, 1:1.5, ...)
 - Core-to-disk ratio (going down with SSDs!)
 - Disk layout (2 HDDs, 3 HDDs, 2 HDDs + 1 SSD, 2 SSDs, ...)
 - Network (1GbE vs 10 GbE)
 - Critical vs physics power
 - Physical location (Geneva vs. Budapest)
 - Network domain (LCG vs. GPN vs. TN)
 - CERN CentOS 7, RHEL7, SLC6, Windows
 - ...
- Variety reflected/accessible via instance types, cells, projects ... variety not necessarily visible to users!
 - We try to keep things simple and hide some of the complexity
 - We can react to (most of the) requests with special needs

Basic Building Blocks: Instance Types

Name	vCPUs	RAM [GB]	Ephemeral [GB]
m2.small	1	1.875	10
m2.medium	2	3.750	20
m2.large	4	7.5	40
m2.xlarge	8	15	80
m2.2xlarge	16	30	160
m2.3xlarge	32	60	320

~80 flavors in total (swap, additional/large ephemerals, core-to-RAM, ...)

Basic Building Blocks: Volume Types

Name	IOPS	b/w [MB/s]	feature	Location	Backend
standard	100	80		GVA	 ceph
io1	500	120	fast	GVA	 ceph
cp1	100	80	critical	GVA	 ceph
cpio1	500	120	critical/fast	GVA	 ceph
cp2	n.a.	120	critical/Windows	GVA	 NetApp
wig-cp1	100	80	critical	WIG	 ceph
wig-cpio1	500	120	critical/fast	WIG	 ceph

m2.* flavor family plus volumes as basic building blocks for services

Automate provisioning with

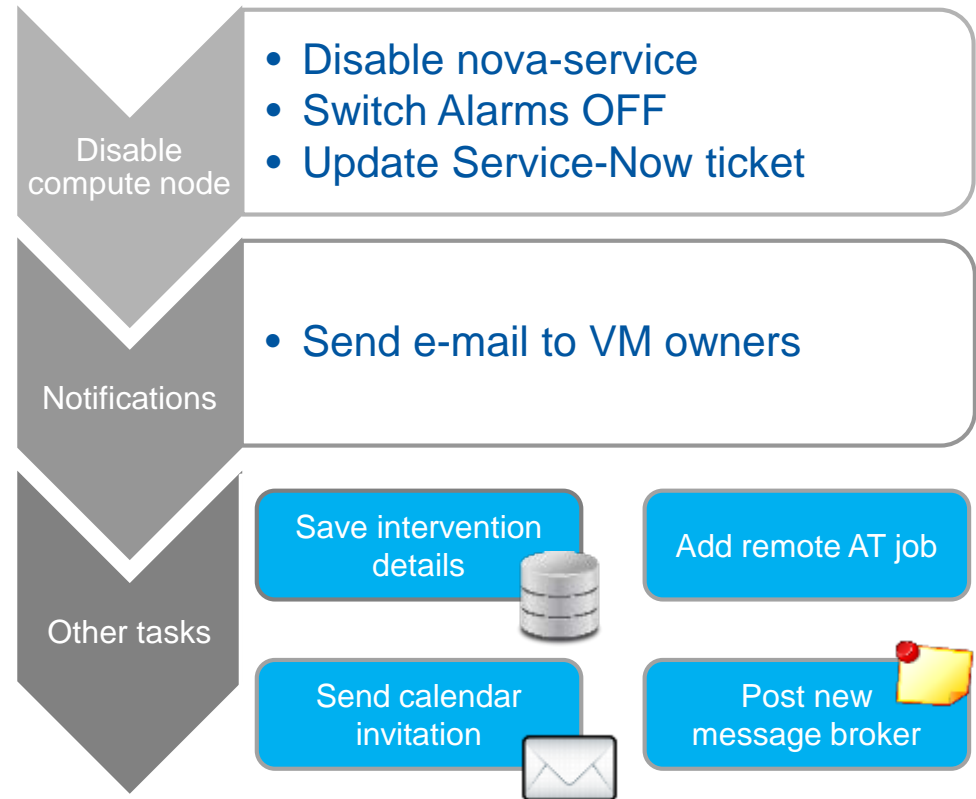

Automate routine procedures

- Common place for workflows
- Clean web interface
- Scheduled jobs, cron-style
- Traceability and auditing
- Fine-grained access control
- ...

Procedures for

- OpenStack project creation
- OpenStack quota changes
- Notifications of VM owners
- Usage and health reports
- ...

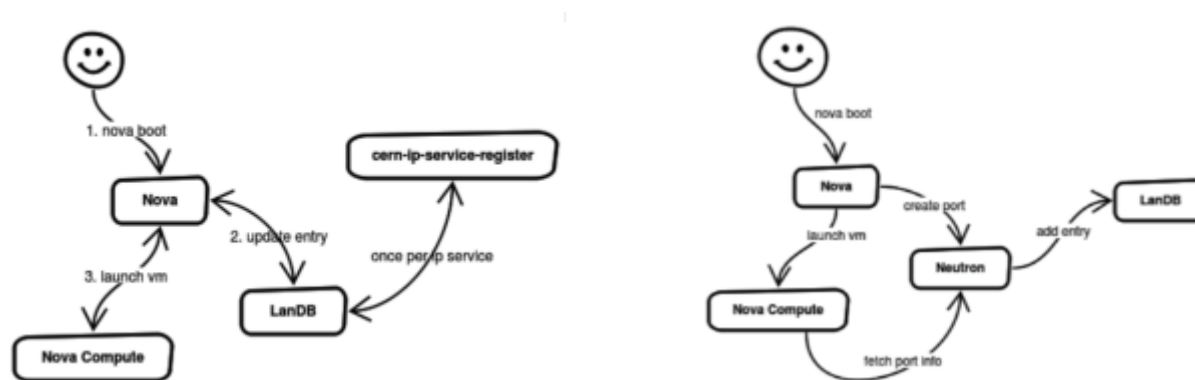

Operations: Retirement Campaign

- About 1'600 nodes to retire from the service by 3Q16
 - ~1'200 from compute, ~400 with services (hosting ~5000 VMs)
- We have gained quite some experience with (manual) migration
 - Live where possible and cold where necessary
 - Works reliably (where it can)
- We have developed a tool that you can instruct to drain hypervisor (or simply migrate given VMs)
 - Main tasks are VM classification and progress monitoring
 - The nova scheduler will pick the target (nova patch)
- We are using the “IP service bridging” to handle CERN network specifics

Operations: Network Migration

- We'll need to replace nova-network
 - It's going to be deprecated (really really really this time)

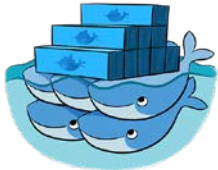

- New potential features (Tenant networks, LBaaS, Floating IPs, ...)
- We have a number of patches to adapt to the CERN network constraints
 - We patched nova for each release ...
 - ... neutron allows for out-of-tree plugins!

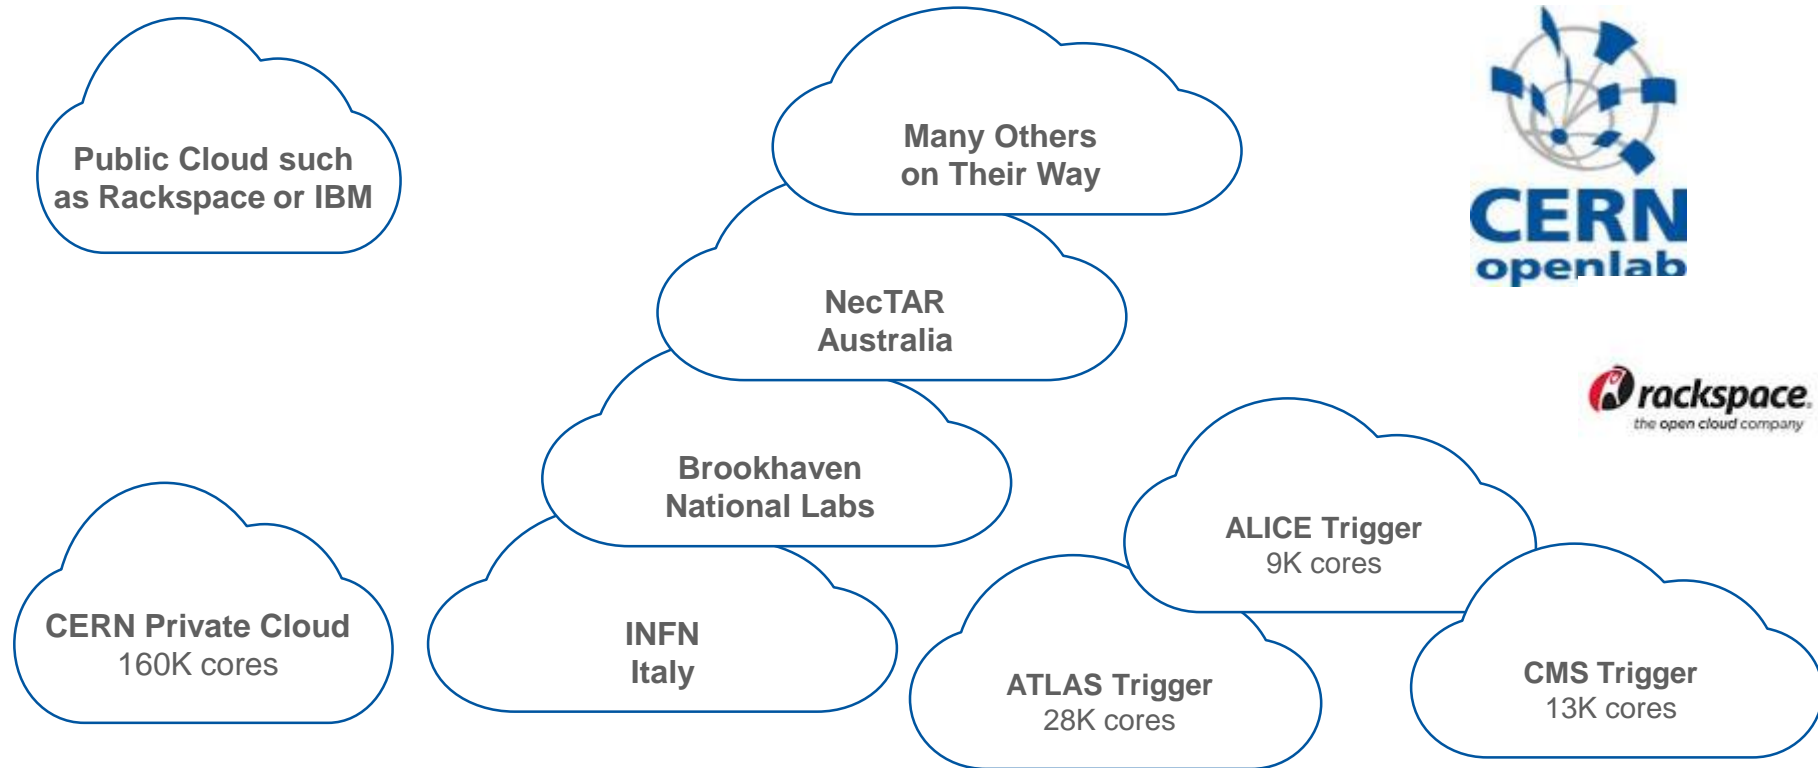

Operations: Neutron Status

- We have ~5 Neutron cells in production
 - Neutron control plane in Liberty (fully HA)
 - Bridge agent in Kilo (nova)
- And it is very stable
 - All new cells will be Neutron cells
- “As mentioned, there is currently no way to cleanly migrate from nova-network to neutron.”
 - All efforts to establish a general migration path failed so far
 - Should be OK for us, various options (incl. in-place, w/ migration, ...)

Operations: Containers

- **Magnum: OpenStack project to treat Container Orchestration Engines (COEs) as 1st class resources**
- **Pre-production service available**
 - Support for Docker Swarm, Kubernetes, Mesos
- **Many users interested, usage ramping up**
 - GitLab CI, Jupyter/Swan, FTS, ...

Operations: Federated Clouds

- Access to EduGAIN users via Horizon
 - Allow (limited) access given appropriate membership

CPU Performance Issues

- The benchmarks on full-node VMs was about 20% lower than the one of the underlying host
 - Smaller VMs much better
- Investigated various tuning options
 - KSM*, EPT**, PAE, Pinning, ... +hardware type dependencies
 - Discrepancy down to ~10% between virtual and physical
- Comparison with Hyper-V: no general issue
 - Loss w/o tuning ~3% (full-node), <1% for small VMs
 - ... NUMA-awareness!

*KSM on/off: beware of memory reclaim!

**EPT on/off: beware of expensive page table walks!

CPU: NUMA

- NUMA-awareness identified as most efficient setting
 - Full node VMs have ~3% overhead in HS06
- “EPT-off” side-effect
 - Small number of hosts, but very visible there
- Use 2MB Huge Pages
 - Keep the “EPT off” performance gain with “EPT on”
- More details in this [talk](#)

Operations: NUMA/THP Roll-out

- Rolled out on ~2'000 batch hypervisors (~6'000 VMs)
 - HP allocation as boot parameter → reboot
 - VM NUMA awareness as flavor metadata → delete/recreate
- Cell-by-cell (~200 hosts):
 - Queue-reshuffle to minimize resource impact
 - Draining & deletion of batch VMs
 - Hypervisor reconfiguration (Puppet) & reboot
 - Recreation of batch VMs
- Whole update took about 8 weeks
 - Organized between batch and cloud teams
 - No performance issue observed since

Future Plans

- Investigate Ironic (Bare metal provisioning)
 - OpenStack as one interface for compute resource provisioning
 - Allow for complete accounting
 - Use physical machines for containers

- Replace Hyper-V by qemu/kvm
 - Windows expertise is a scarce resource in our team
 - Reduce complexity in service setup

Summary

- **OpenStack at CERN in production since 3 years**
 - We're working closely with the various communities
 - OpenStack, Ceph, RDO, Puppet, ...
- **Cloud service continues to grow and mature**
 - While experimental, good experience with Nova cells for scaling
 - Experience gained helps with general resource provisioning
 - New features added (containers, identity federation)
 - Expansion planned (bare metal provisioning)
- **Confronting some major operational challenges**
 - Transparent retirement of service hosts
 - Replacement of network layer
