

High Throughput Computing for CERN's Large Hadron Collider

Havard Bjerke
CERN openlab
22 June 2008

CERN
openlab

Overview of CERN

What is CERN?

- CERN is the world's largest particle physics centre
- Particle physics is about:
 - elementary particles, the constituents all matter in the Universe is made of
 - fundamental forces which hold matter together
- Particle physics requires:
 - special tools to create and study new particles
 - Accelerators
 - Particle Detectors
 - Powerful computers

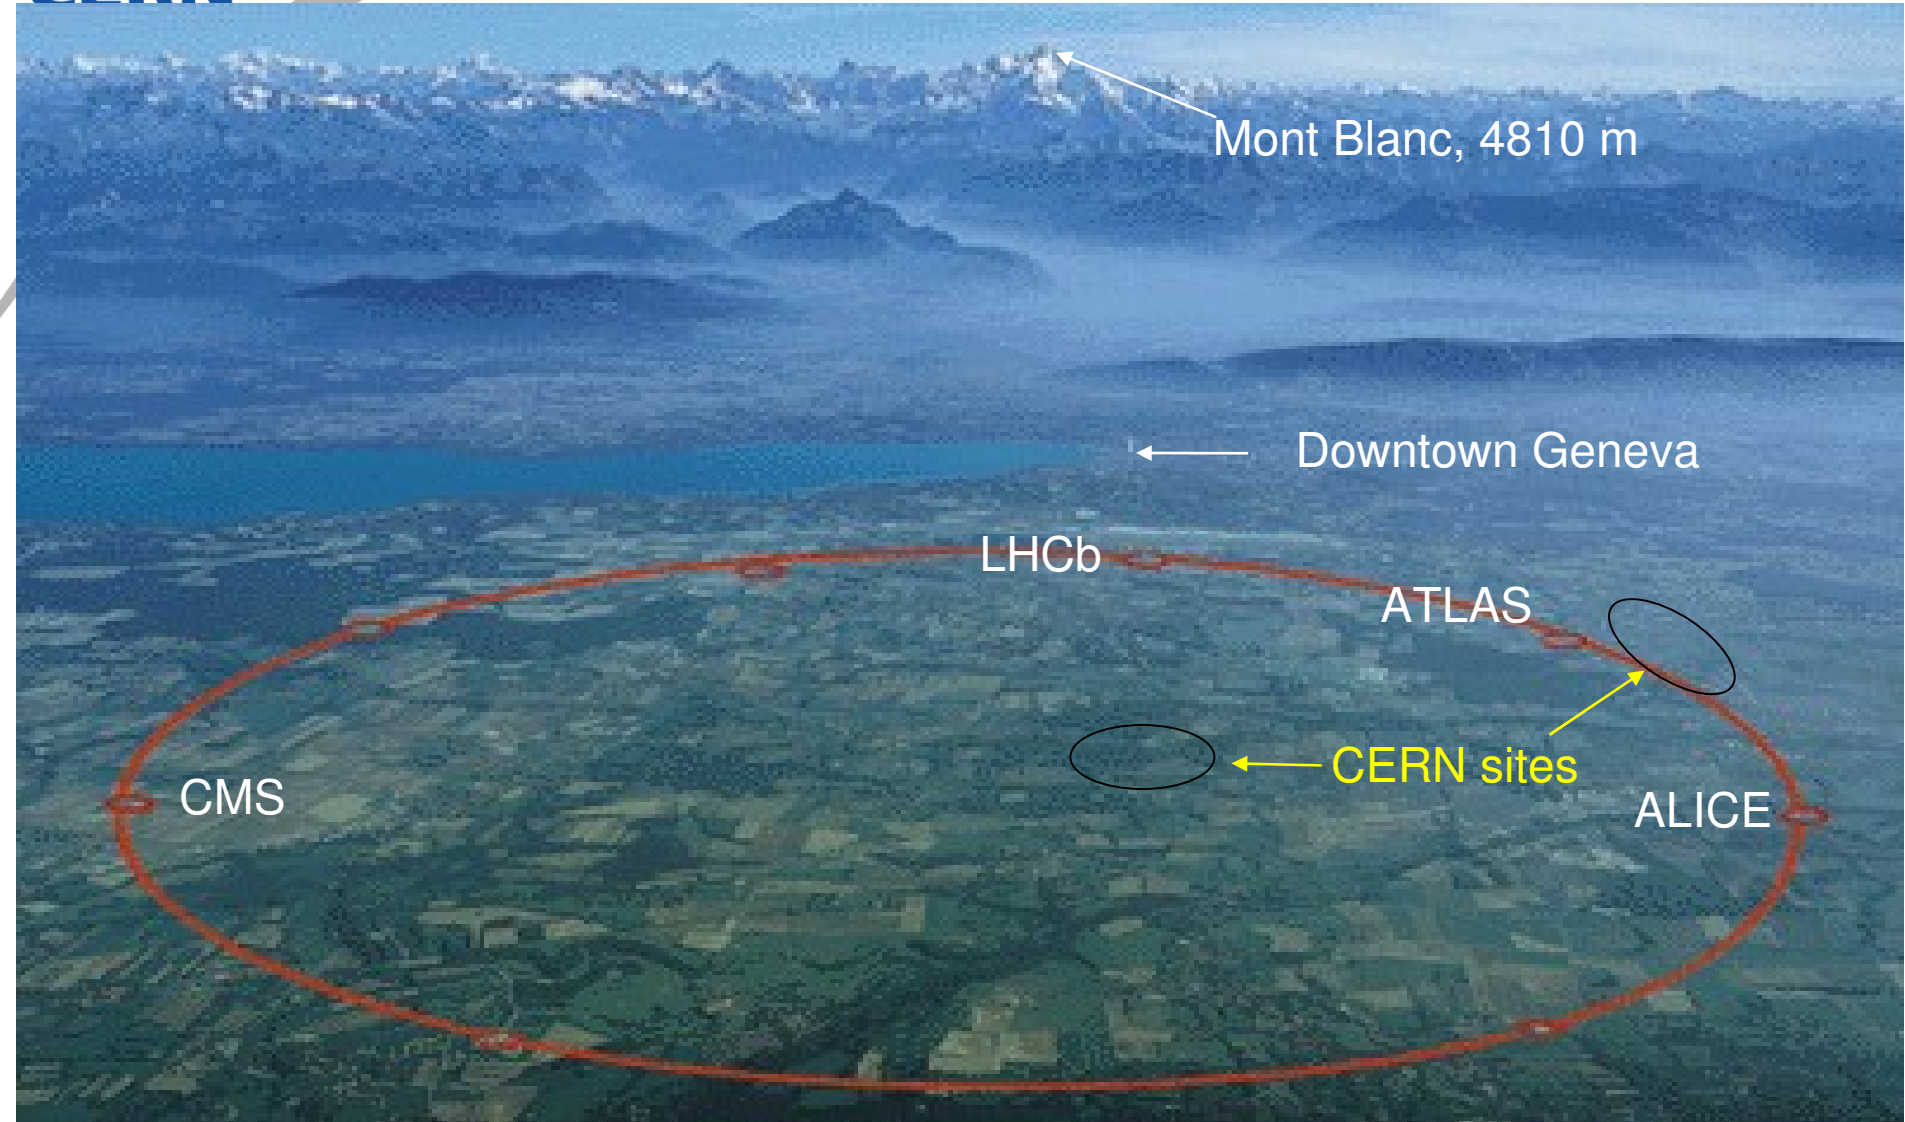

CERN is also:

- ***2500 staff (physicists, engineers, technicians, ...)***
- ***Some 6500 visiting scientists (half of the world's particle physicists)***
- They come from 500 universities representing 80 nationalities.***

The CERN Site

CERN's accelerators

The world's most complete accelerator complex

protons
 ions
 neutrons

antiprotons
 electrons
 neutrinos

AD Antiproton Decelerator
 PS Proton Synchrotron
 SPS Super Proton Synchrotron

LHC Large Hadron Collider
 n-ToF Neutron Time of Flight
 CNGS CERN Neutrinos Gran Sasso

CTF3 CLIC Test Facility 3

What is LHC?

- The Large Hadron Collider will collide beams of protons at an energy of 14 TeV (in the summer of 2008)
- Using the latest super-conducting technologies, it will operate at about -271°C , just above the temperature of absolute zero.
- With its 27 km circumference, the accelerator will be the largest superconducting installation in the world.

Four experiments, with detectors as 'big as cathedrals':
ALICE
ATLAS
CMS
LHCb

- General purpose LHC detector – 7000 tons

CERN
openlab

Compact Muon Solenoid (CMS)

Data management and computing

LHC data (simplified)

Per experiment:

- 40 million beam interactions per second
- After filtering, 100 collisions of interest per second
- A Megabyte of digitized information for each collision = recording rate of 0.1 Gigabytes/sec
- 1 billion collisions recorded = 1 Petabyte/year

1 Megabyte (1MB)
A digital photo

1 Gigabyte (1GB)
= 1000MB
A DVD movie

1 Terabyte (1TB)
= 1000GB
World annual book production

1 Petabyte (1PB)
= 1000TB
The annual production by one LHC experiment

1 Exabyte (1EB)
= 1000 PB
World annual information production

CMS

LHCb

ATLAS

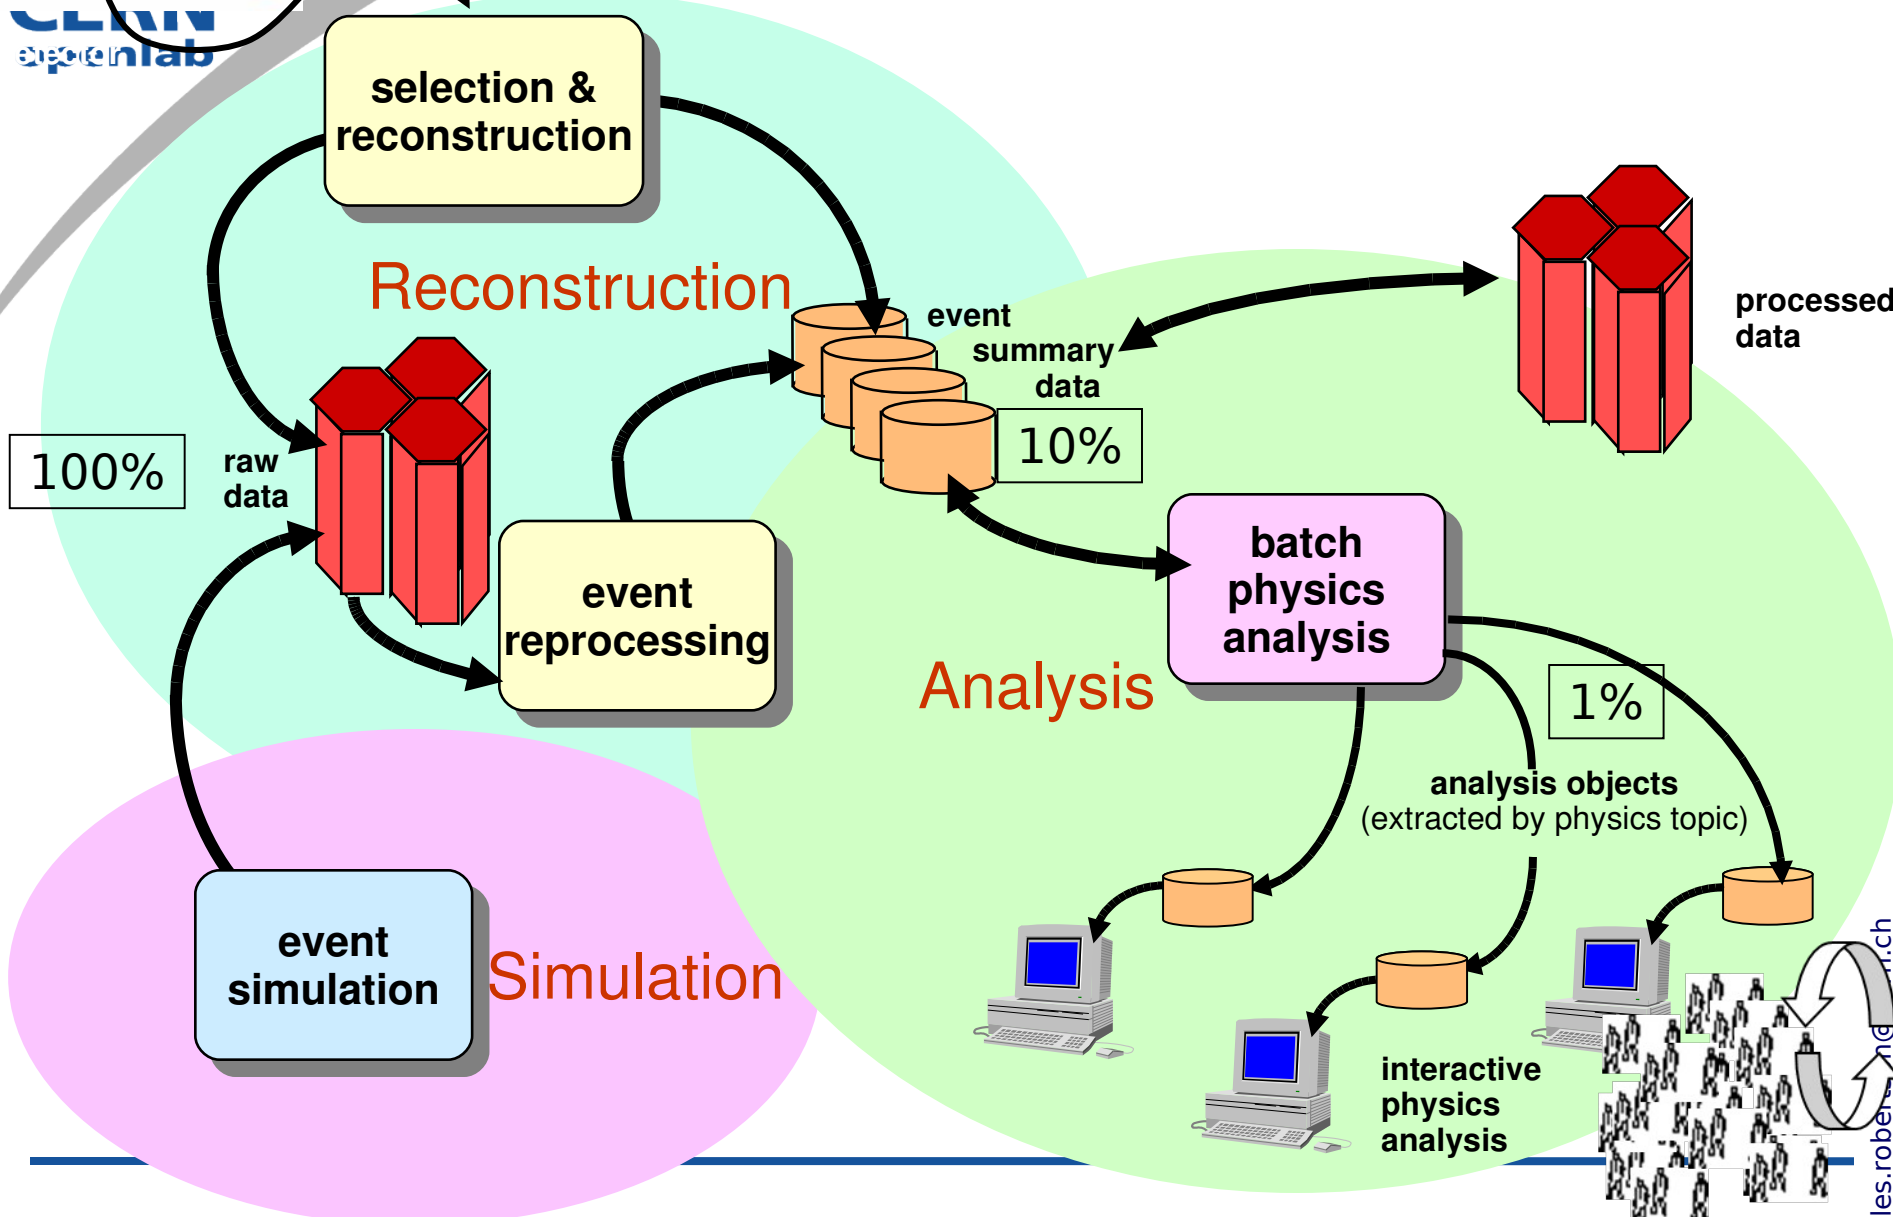

ALICE

Data Handling and Computation for Physics Analysis

High Energy Physics Computing Characteristics

- Independent events (collisions of particles)
 - **trivial** (read: pleasant) **parallel processing**
- Bulk of the data is read-only
 - versions rather than updates
- Meta-data in databases linking to “flat” files
- Compute power scales with **SPECint** (not SPECfp)
 - But good floating-point (20% of total) is important!
- **Very large aggregate requirements**:
 - computation, data, input/output
- **Chaotic workload** –
 - research environment - physics extracted by iterative analysis, collaborating groups of physicists
 - Unpredictable → unlimited demand

SHIFT architecture

(Scalable Heterogeneous Integrated Facility)

In 2001 SHIFT won the **21st Century Achievement Award** issued by Computerworld

CERN
openlab

Computing at CERN today

**Nowhere
near
enough!**

- High-throughput computing based on reliable “commodity” technology
- About 3000 dual-socket PC servers running Linux
- Petabytes of data on tape and on disk

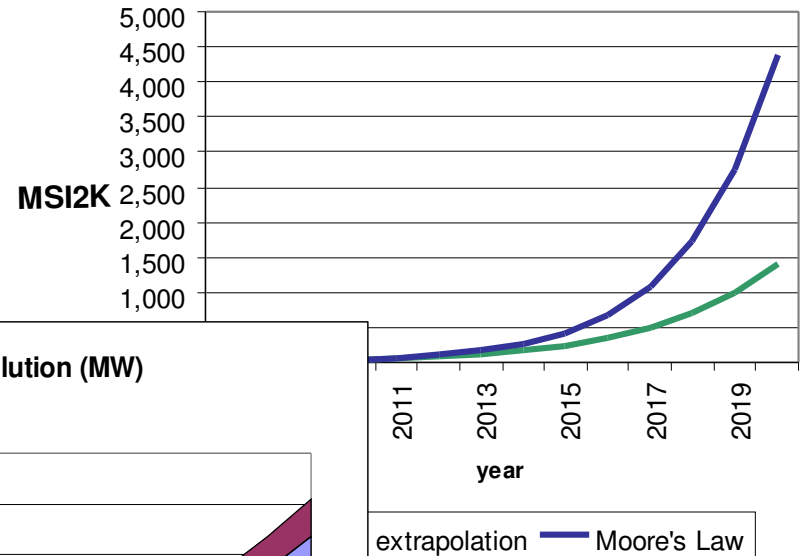

LHC computing capacity development

Development of computing capacity with a constant budget, given the increased cost for power and cooling

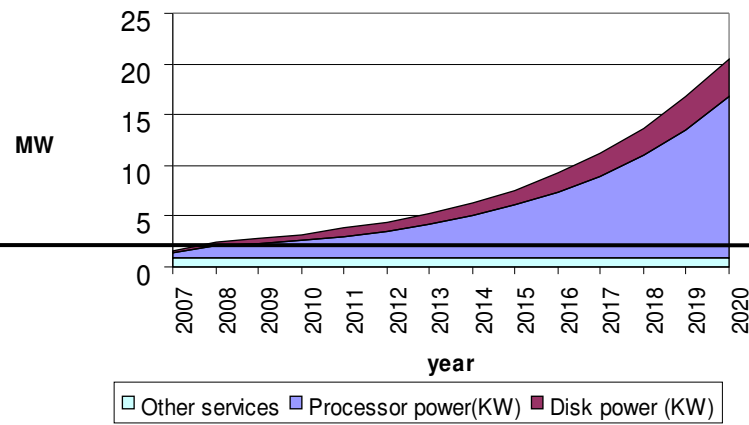

Installed Disk Capacity

Installed CPU Capacity

Input Power Evolution (MW)

Power limit of present Computer Centre

CERN

Why do we need a Grid?

- The LHC Computing requirements are simply too huge:
 - Political resistance to putting everything at CERN
 - Impractical to build such a huge facility in one place
 - The users are in any case not necessarily at CERN
 - Modern wide-area networks have made distances shrink
 - But, latency still has to be kept in mind
- So, we are spreading the burden!

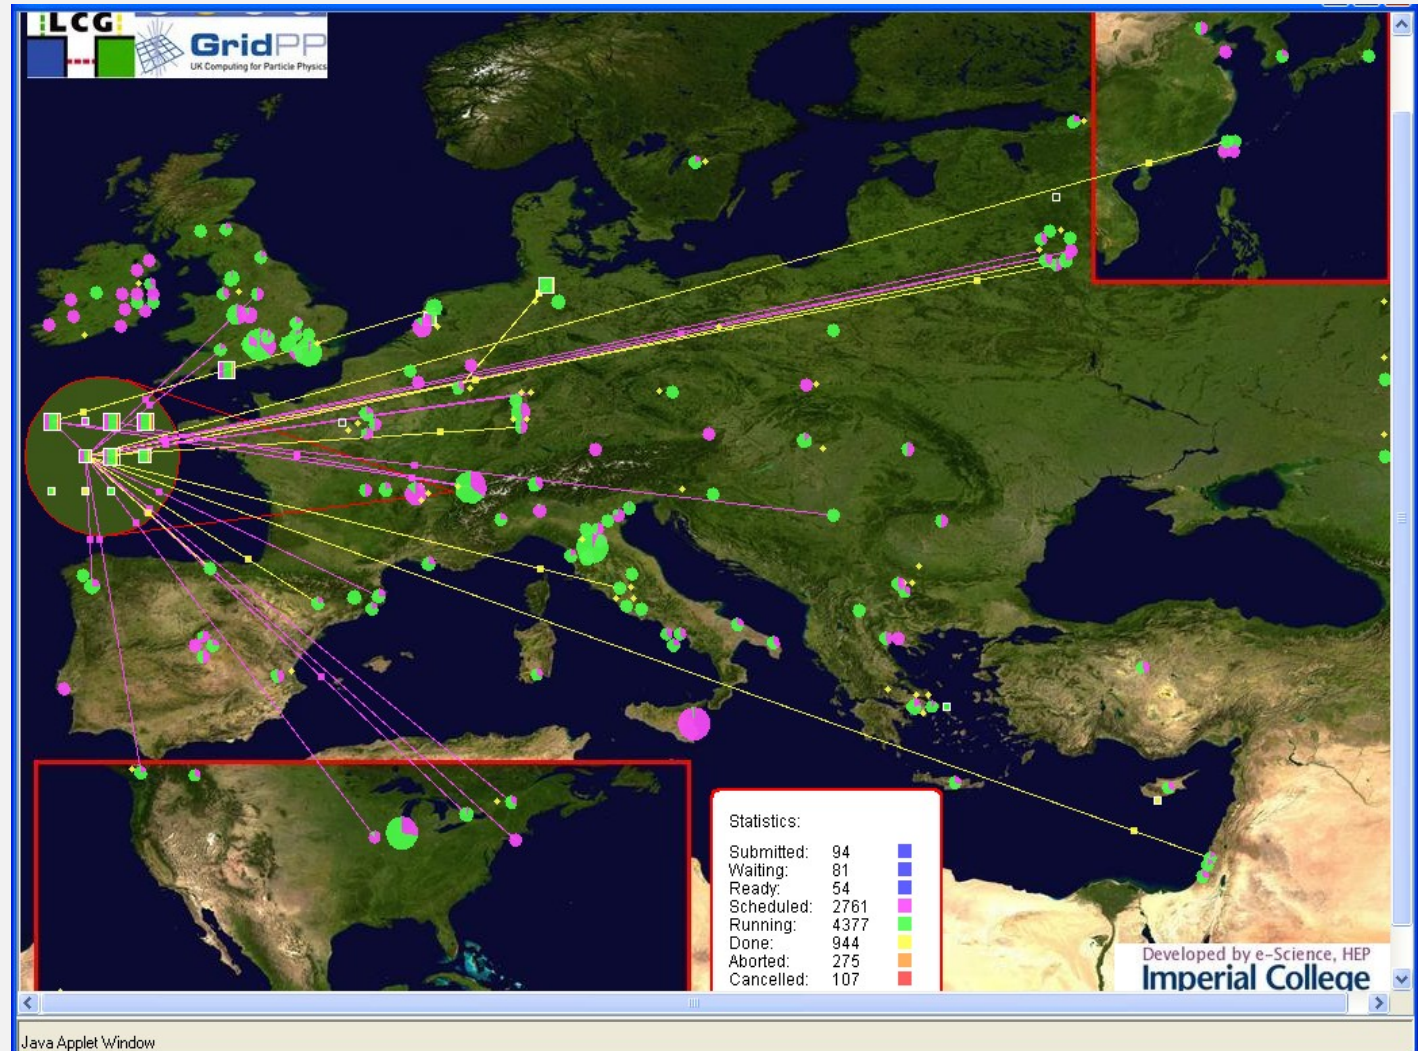

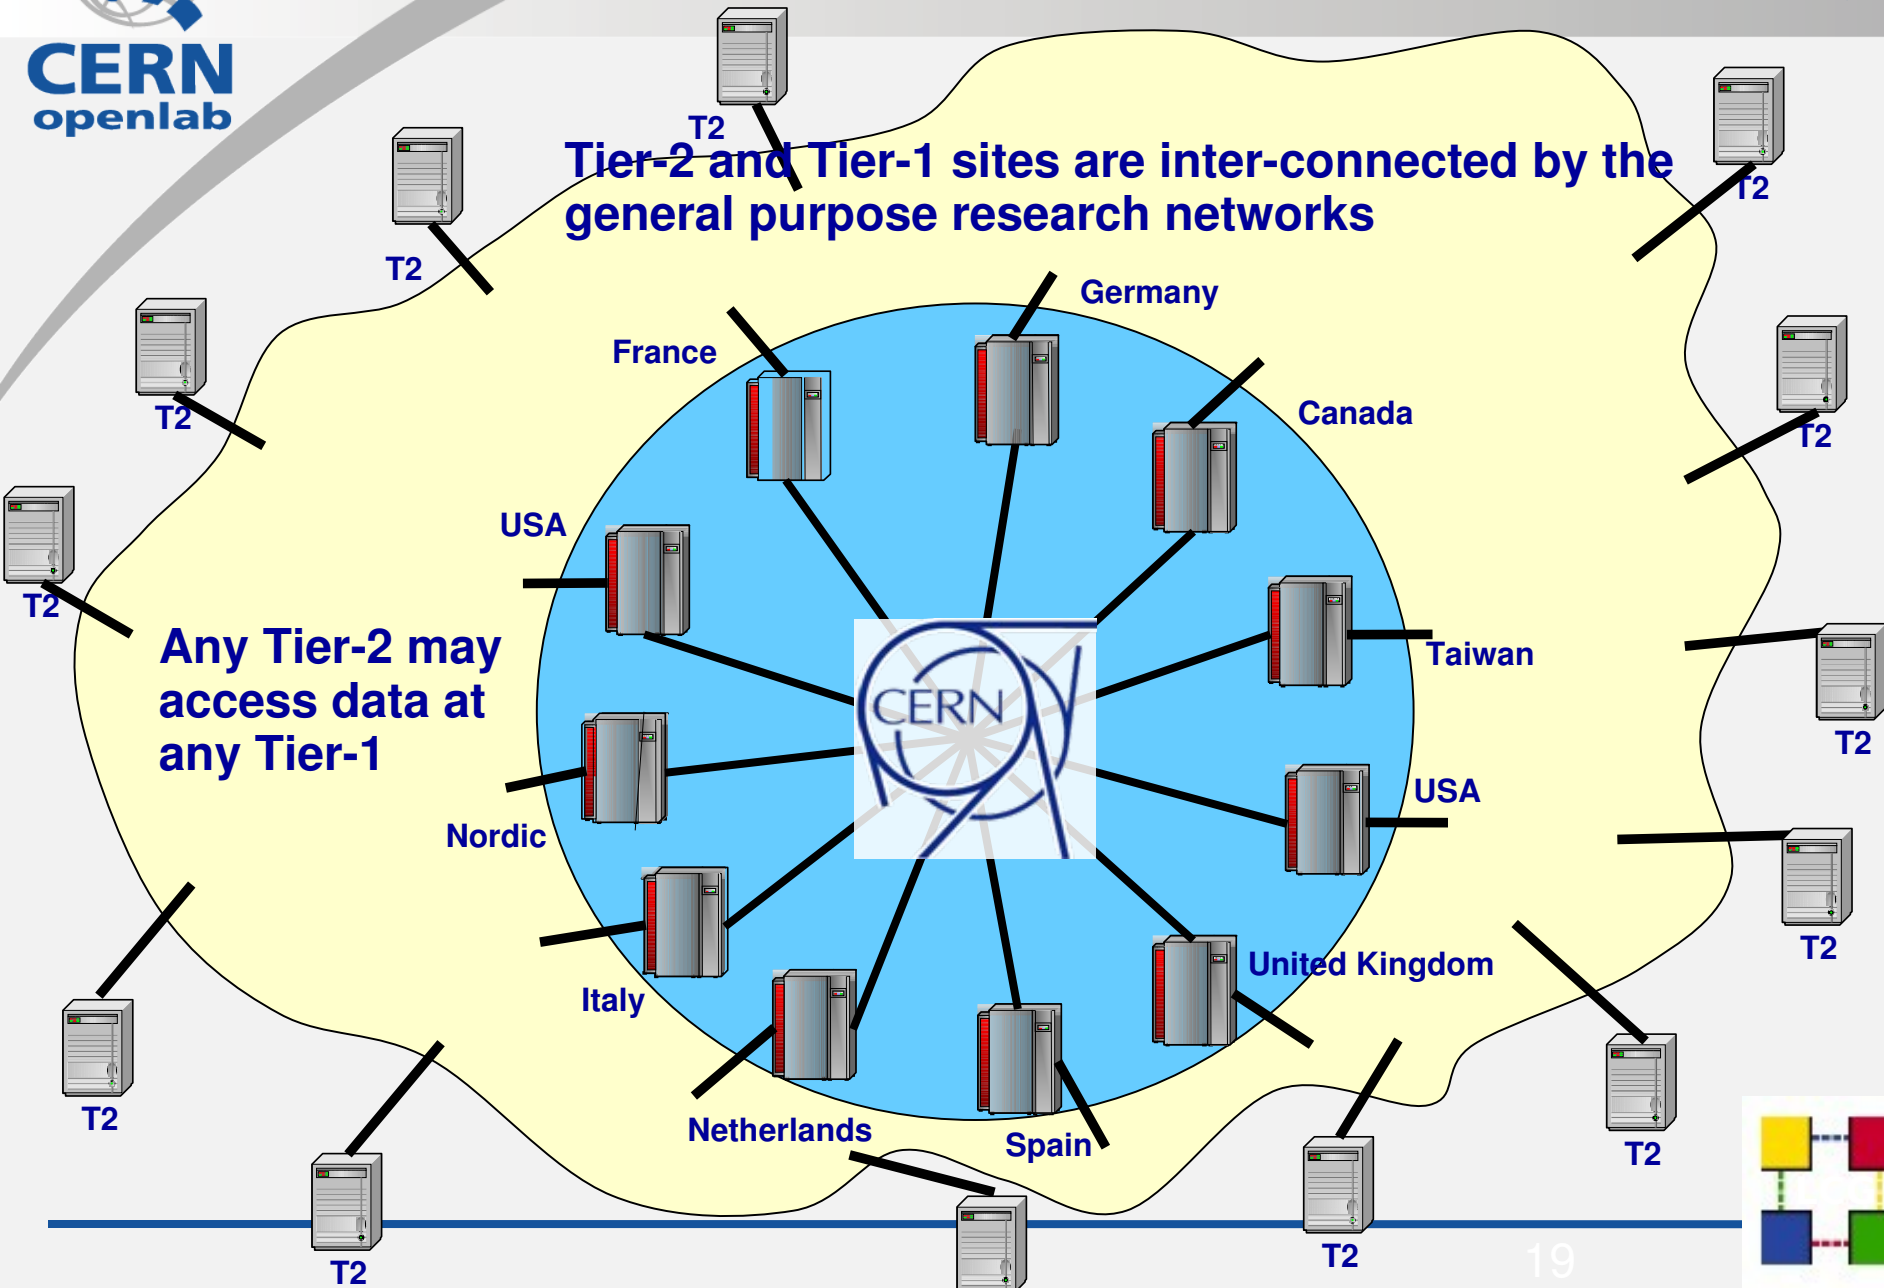

eGEE
Enabling Grids for
E-science in Europe

- Largest Grid service in the world !

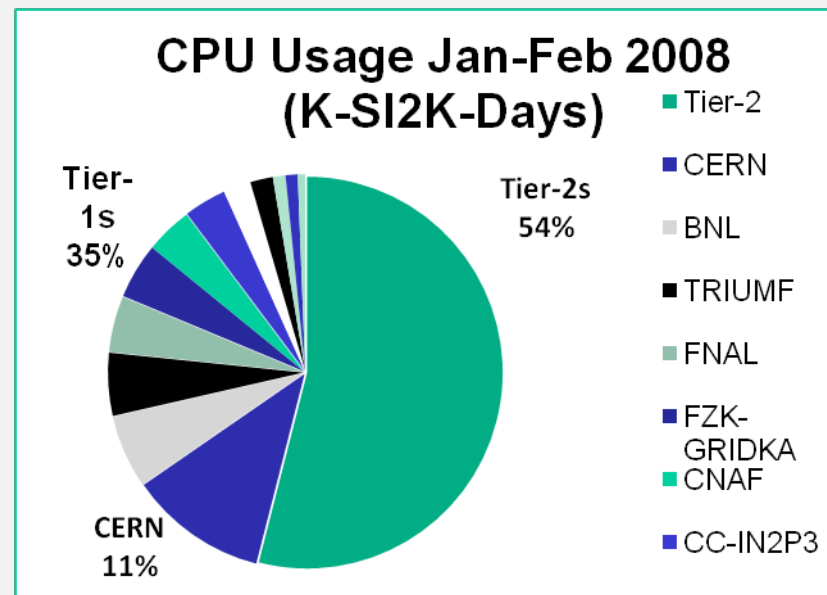

- Almost 150 sites in 35 countries
- 100'000 IA-32 processor cores (w/Linux)
- Tens of petabytes of storage

- WLCG ran ~ 44 million jobs in 2007 – workload has continued to increase
- Distribution of work across Tier0 / Tier1 / Tier 2 really illustrates the importance of the grid system
 - Tier 2 contribution is around 50%; > 85% is external to CERN
- Data distribution from CERN to Tier-1 sites
 - Latest test in February show that the data rates required for LHC start-up have been reached and can be sustained over long periods

CERN
openlab

EGEE
Enabling Grids
for E-science

- EGEE
 - Started in April 2004, now in second phase with 91 partners in 32 countries
 - 3rd phrase (2008-2010) started 1st May 2008
- Objectives
 - Large-scale, production-quality grid infrastructure for e-Science
 - Attracting new resources and users from industry as well as science
 - Maintain and further improve “gLite” Grid middleware

- More than 25 applications from an increasing number of domains
 - Astrophysics
 - Computational Chemistry
 - Earth Sciences
 - Financial Simulation
 - Fusion
 - Geophysics
 - High Energy Physics
 - Life Sciences
 - Multimedia
 - Material Sciences
 -

Background to the CERN openlab

- Information Technology has ALWAYS moved at an incredible pace
- During the LEP era (1989 – 2001) CERN changed its computing infrastructure twice:
 - Mainframes (1x) → RISC servers (30x) → PC servers (1000x)
- In openlab, we collaborate to harness the advantages of a continuous set of innovations for improving scientific computing, such as:
 - 10 Gigabit networks, 64-bit computing, Virtualization
 - Performance improvements (Moore's law): HW and SW
 - Many-core throughput increase, Thermal optimization
- We work with a long-term perspective:
 - LHC will operate until at least 2020!

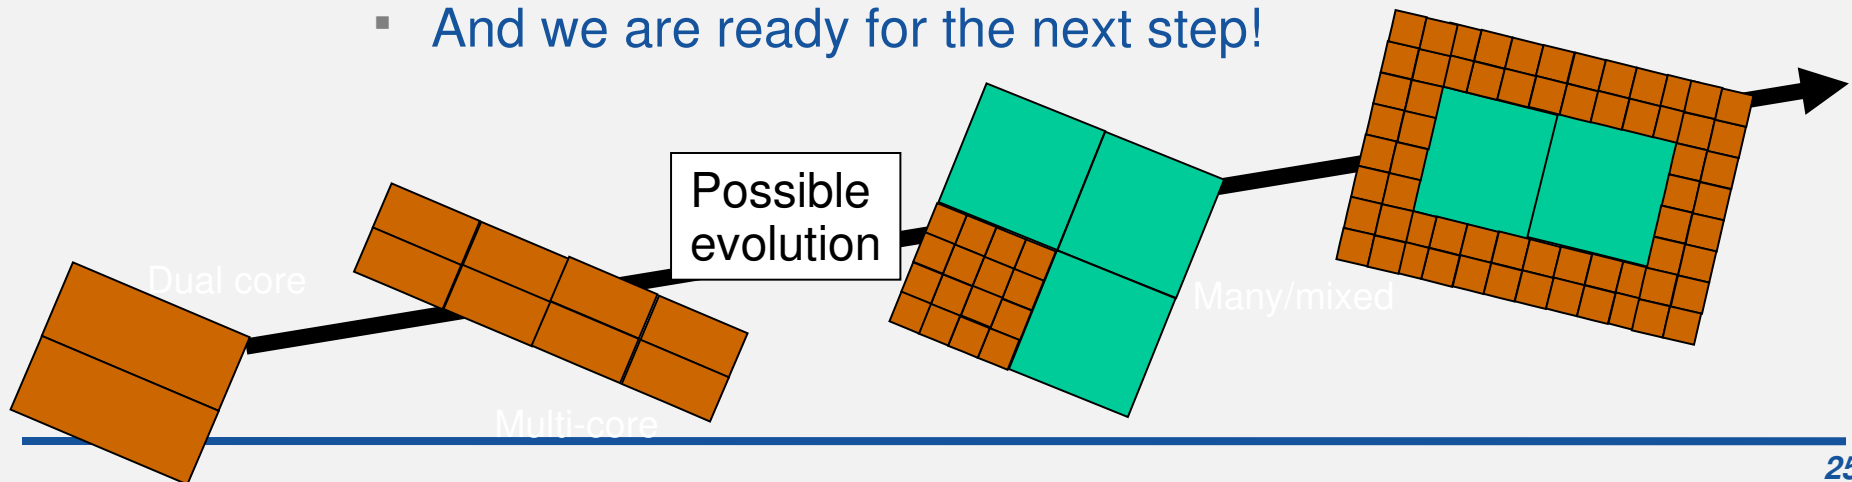

- Intel-related activities:
 - Performance/throughput improvements
 - Compiler improvement project
 - Tuning of physics applications
 - Performance Monitoring
 - Benchmarking w/SPEC and Oracle
 - Multithreading applications
 - TOP500 runs
 - Virtualization
 - Thermal optimization
 - Servers and entire Computer Centre
 - 10 Gb networking
 - New processors/new languages

From Multi to Many

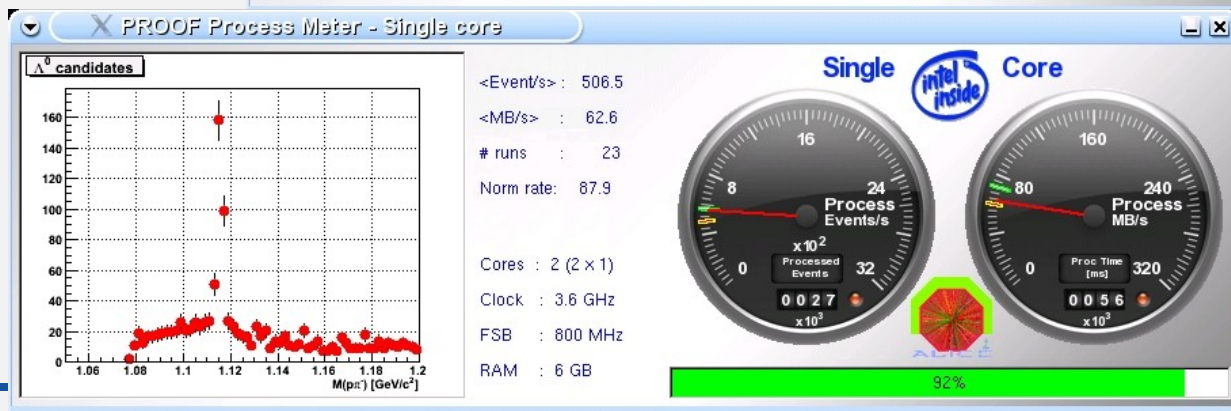

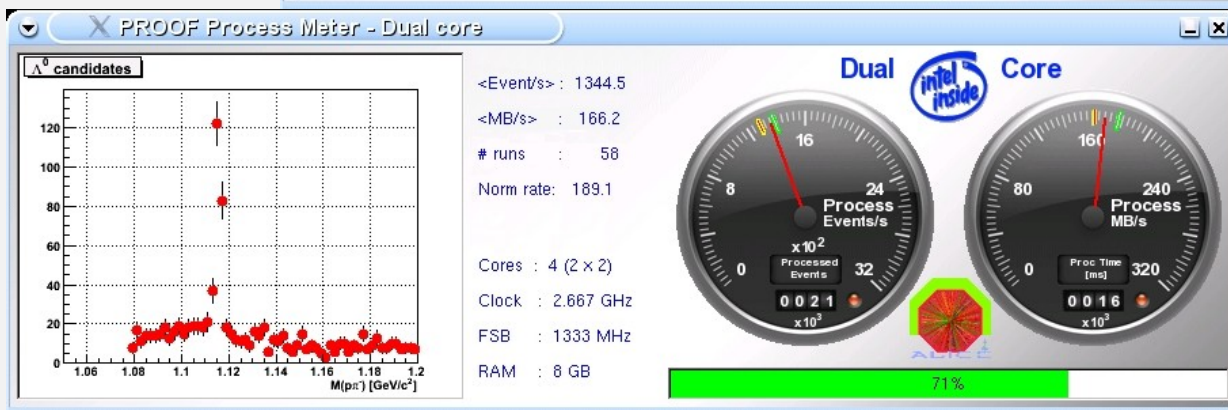

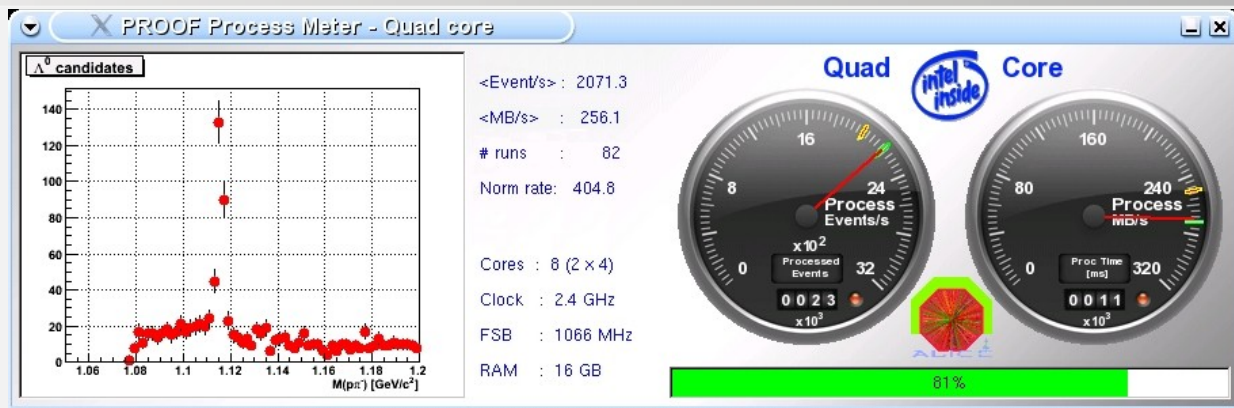

- Our “high throughput” computing model is ideally suited:
 - Independent processes can run on each core, provided that:
 - Main memory is added
 - Bandwidth to main memory remains reasonable
 - Testing, so far, has been very convincing
 - Single → Dual → Quad
- In November 2006, Intel announced their Quad-core processor in the CERN Globe
 - All our acquisitions are now QC (Clovertown/Harpertown)
 - And we are ready for the next step!

Backup

The CERN openlab

- Department's main R&D focus
- Framework for collaboration with industry
- Evaluation, integration, validation
 - of cutting-edge technologies that can serve the LHC Computing Grid (LCG)
- Sequence of 3-year agreements
 - 2003 – 2005: Phase I: the “opencluster” project
 - 2006 – 2008: Phase II Multiple Competence Centres

High performance test bed: the opencluster

CERN
openlab

Multi-threading activities

- Aim: Evangelize/teach parallel programming
- Two workshops arranged w/Intel in 2007
 - 1 day lectures, 1 day exercises
 - 5 lecturers (2 Intel + 3 CERN)
 - 45 participants
 - Next workshop: Late Spring 2008
- Licenses for the Intel Threading Tools (and other SW products) available
 - to all CERN users
- Advances in Geant4 parallelization experiment
- Recently also Minuit/ROOT

**Multi-threading and Parallelism
WORKSHOP**
4th-5th of October 2007, CERN

A second instance of the Multi-threading and Parallelism Workshop will be held on the 4th and 5th of October 2007 at CERN. Experts from Intel will lead the two day event and help you improve your knowledge by explaining the key intricacies of parallel programming and presenting the most efficient solutions to popular multi-threading problems.

Event highlights:

- Day 1: Fundamental aspects of multi-threaded and parallel computing
 - The move to multi-core and its impact on software
 - Important performance and multi-threading concepts
 - Threaded programming methodology and scalability issues
 - OpenMP and POSIX Threads discussion
 - CERN-specific parallelism related topics
- Day 2: Hands-on lab
- Q&A with Intel experts - all topics, from beginner to advanced

The workshop is co-organized by CERN OpenLab and Intel for users affiliated with CERN. Registrations are based on a limited first-come-first-served basis. An online pre-test is available at <http://cern.ch/openlab/mtp>. All seats are subject to availability. For an application form - please indicate which level of product is most important for your organization. Go to <http://cern.ch/openlab/mtp> for more information and to register for a seat.
