# ICE-DIP Project: Research on data transport for manycore processors for next generation DAQs

Aram Santogidis

Background image: Shutterstock

ICE-DIP is a European Industrial Doctorate project funded by the European Community's 7th Frameworkprogramme Marie Curie Actions under grant PITN-GA-2012-316596

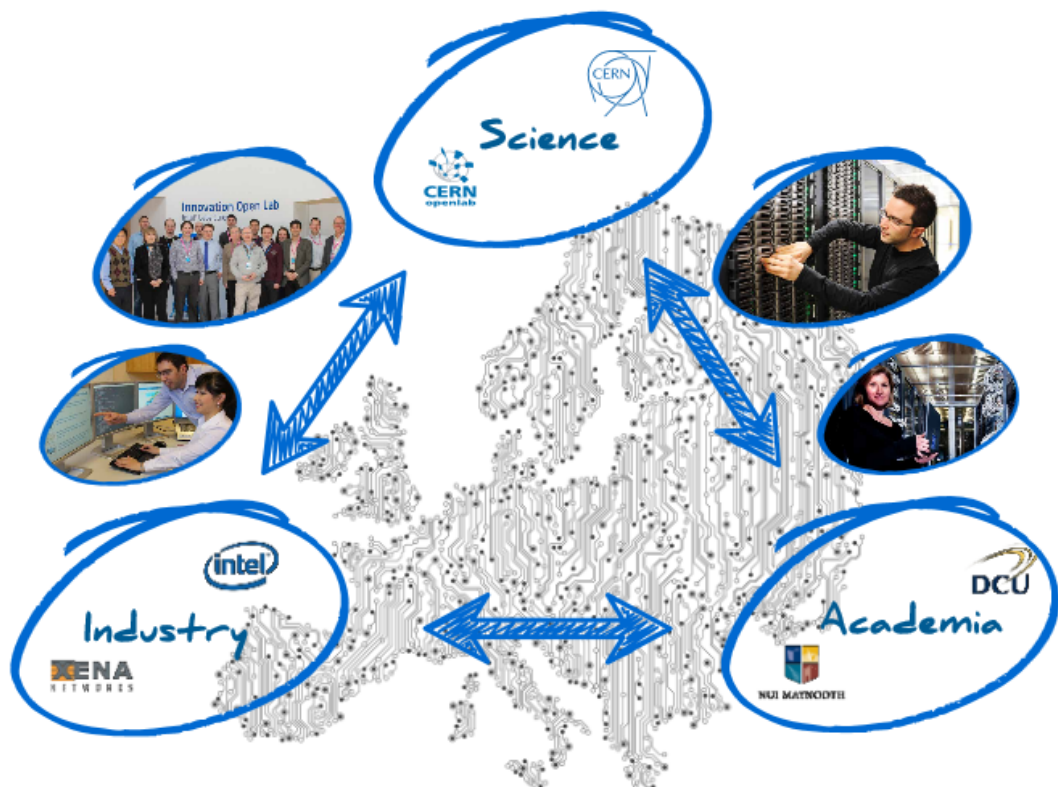

# ICE-DIP 2013-2017: The Intel-CERN European Doctorate Industrial Program

» A public-private partnership to research solutions for next generation data acquisition networks, offering research training to five Early Stage Researchers in ICT

## Research topics:

- ▶ Silicon photonics systems
- ▶ Next generation data
- ▶ High speed configurable logic
- ▶ Computing solutions for high performance data filtering

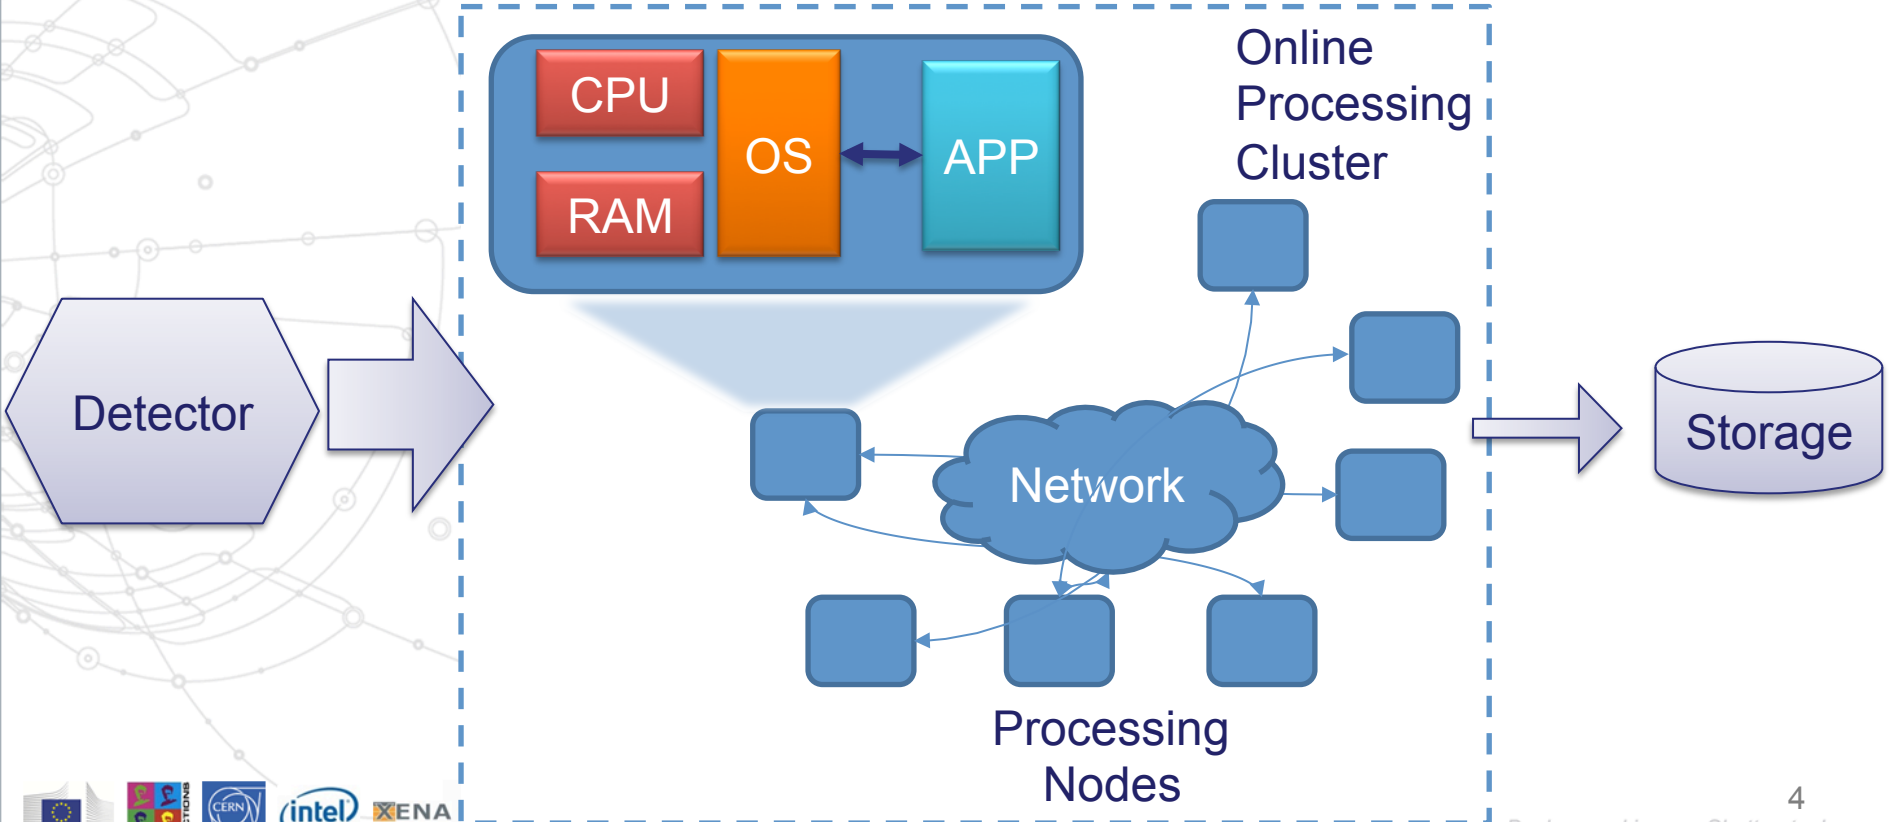

# The points of my research

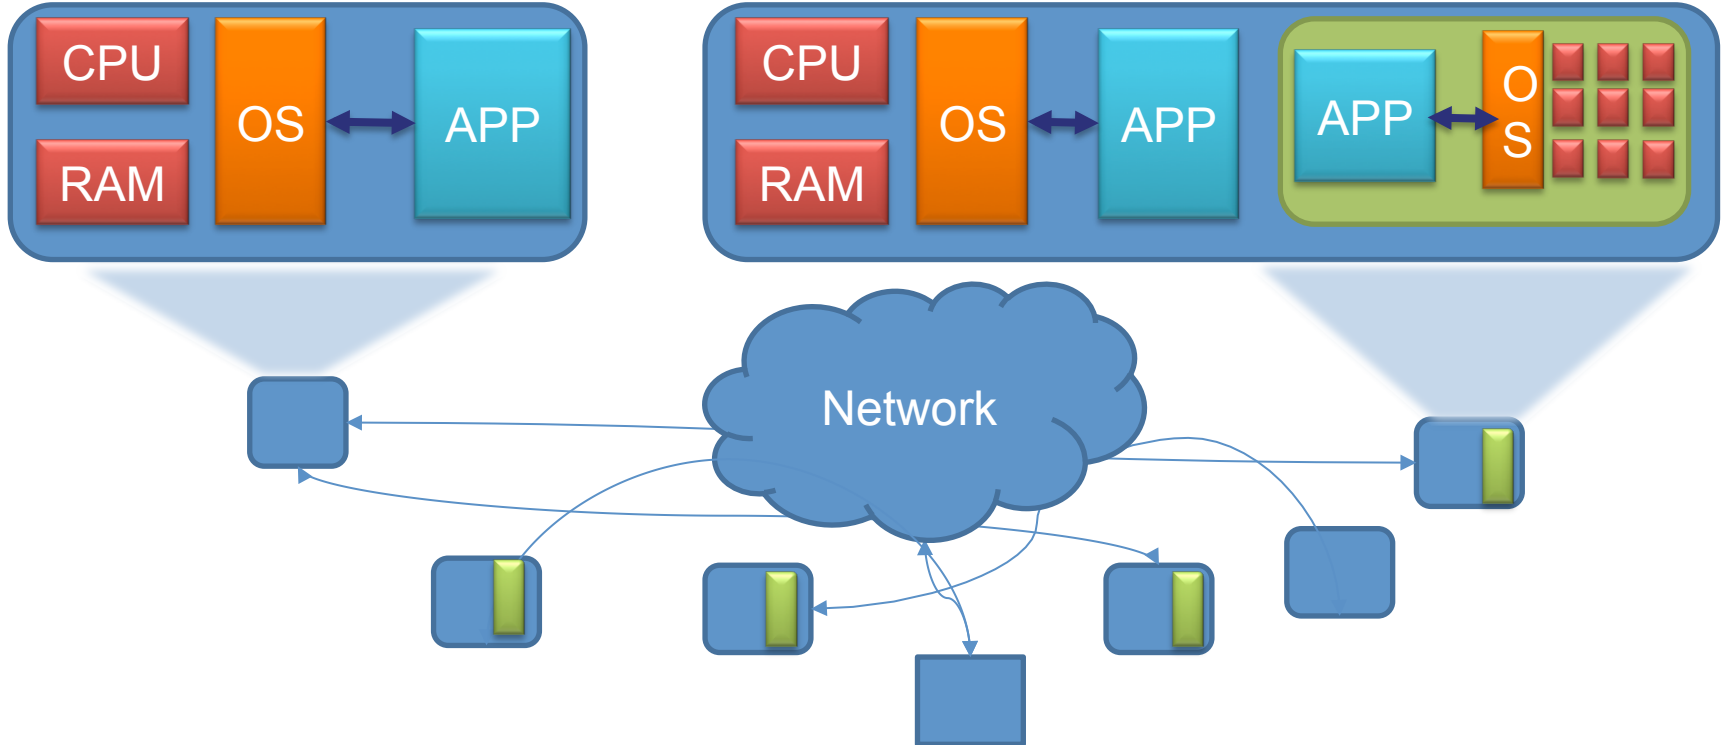

## Data Transfer

- › Move data fast to manycore processors
- › Develop easy to use intra/inter-machine communication interface
- › Study the trade-offs of related communication patterns and mechanisms
- › Conduct this research in the context of next generation DAQs

# Distributed application for online processing

# Heterogeneous computing with manycore co-processors

# We need high efficient transport

IMC (intra-machine)

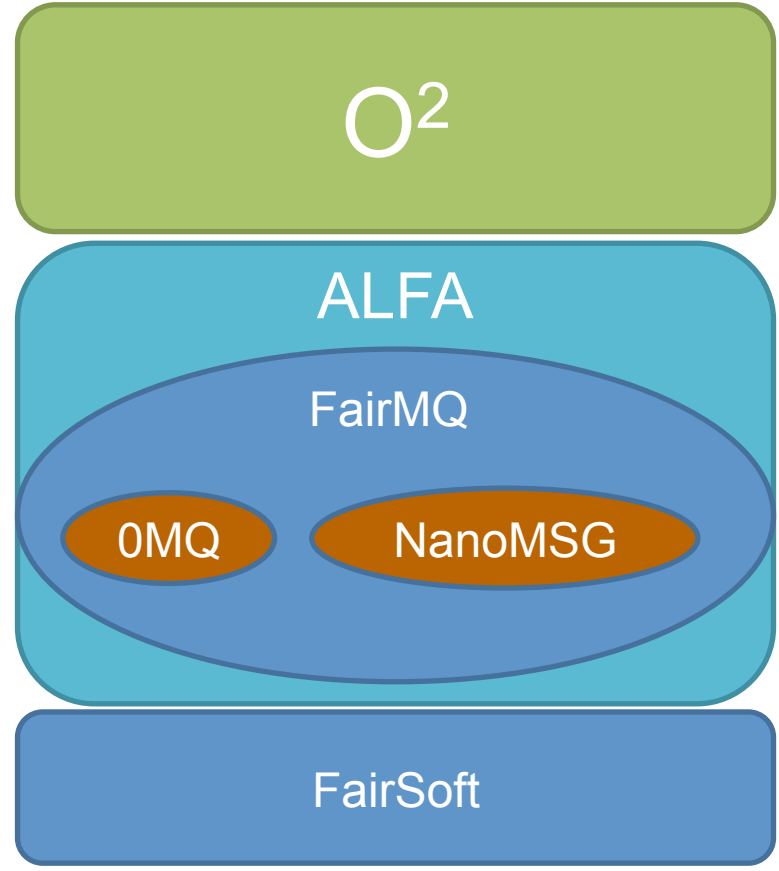

A server executing part of the O<sup>2</sup> distributed processing system.

A server equipped with a manycore co-processor executing “accelerated” apps.

Online-Offline  
system for  
ALICE

Software  
framework for  
ALICE and Fair  
experiments

External  
Dependencies

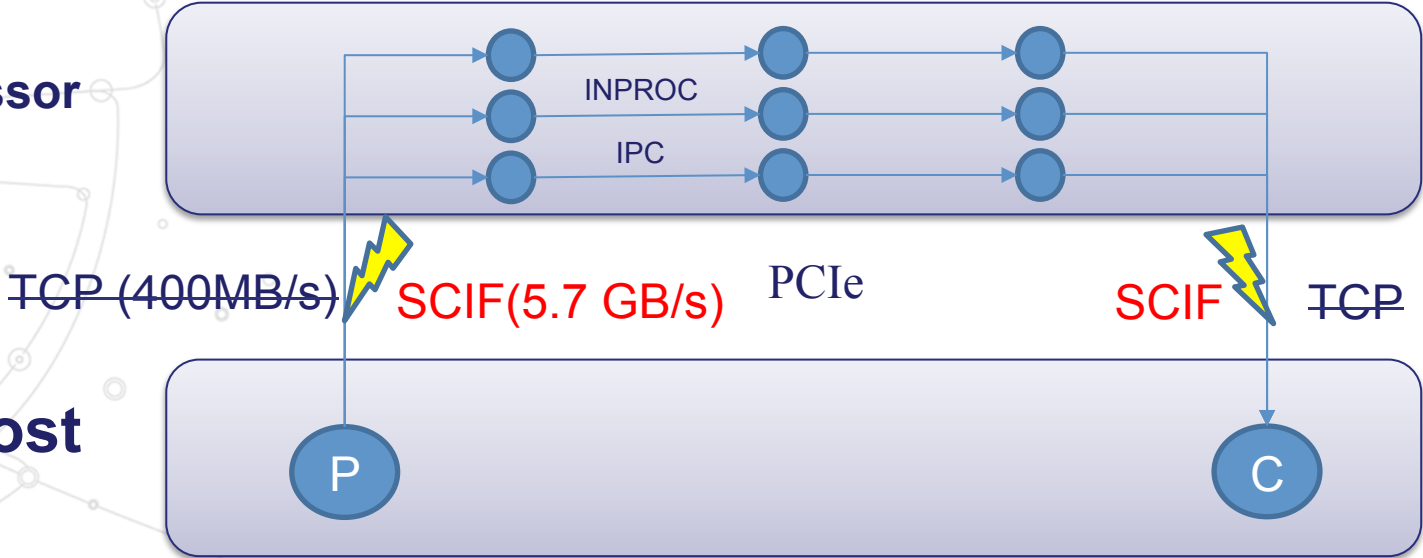

# Boosted NanoMSG's performance of Intra-machine communication

NN\_PIPELINE (Push/Pull)

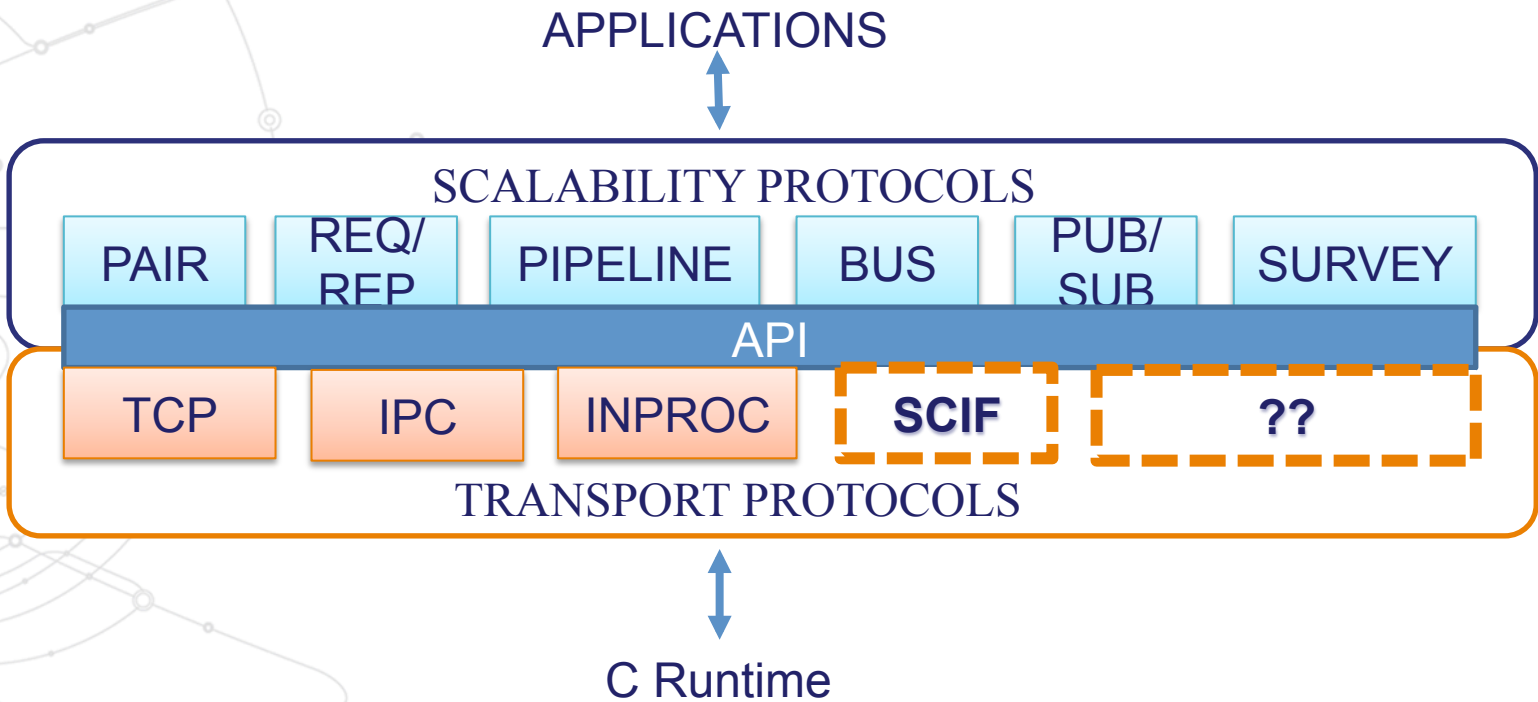

Co-Processor

Host

# NanoMSG extended with SCIF support

# Future plans

- › Focus more on ZeroMQ
- › Develop a message-passing to RDMA mapping protocol
- › Study ALFA and O<sup>2</sup>
- › Experiment on infiniband hardware
- › Work on getting early access on KNL and OmniPath.

# DISCUSSION QUESTIONS

CERN openlab
