

SmartFrog: brief overview & first experiences

**Andreas Unterkircher
CERN openlab**

What's it all about ?

- **SmartFrog = Smart Framework for Object Groups**
- **Describe, deploy, ignite and manage **distributed** applications**
- **Developed over several years at hp Labs in Bristol**
- **Planned to be released under the LGPL open source license by the end of 2003**
- **Openlab has an old beta version**

SmartFrog Framework

- 1. Configuration description language**
- 2. Component Model**

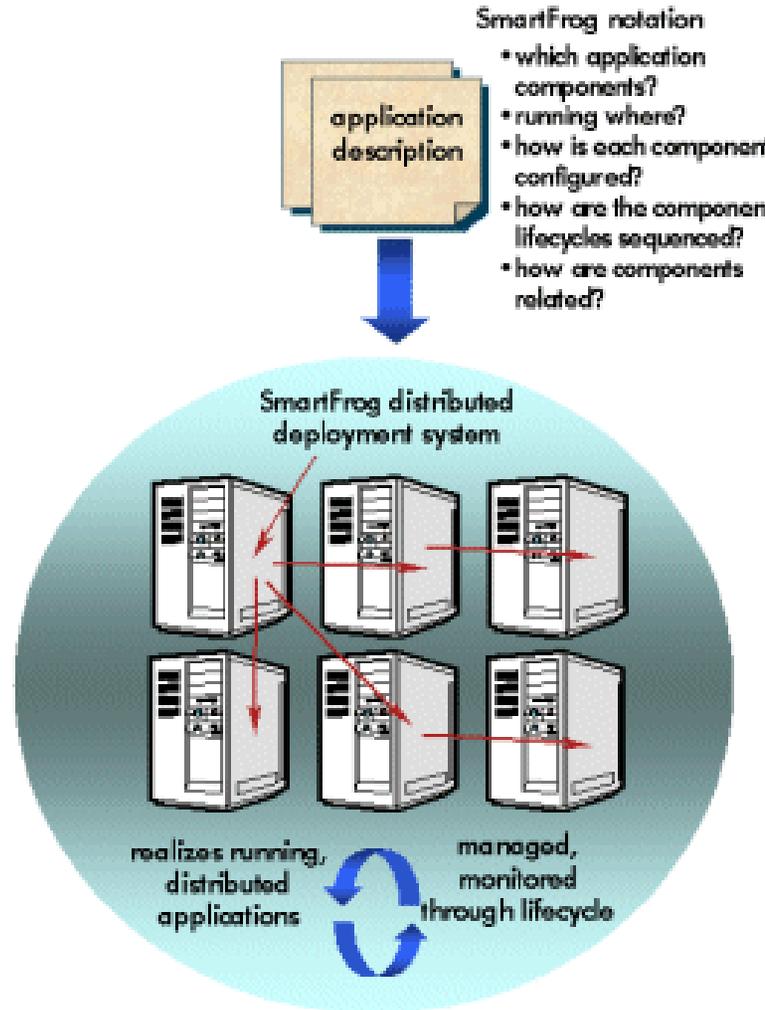

System = collection of components
lifecycle management

3. Runtime System

SmartFrog daemon on every machine
Interprets system descriptions and creates components
locate/interconnect components

SmartFrog Framework

Language

```
#include "componentsJetty.sf"

fileServer "oplapro26.cern.ch";
commonPort "8080";

sfConfig extends {
    serverUp extends HttpServer {
        sfProcessHost ATTRIB fileServer;
        port ATTRIB commonPort;
    }
}
```

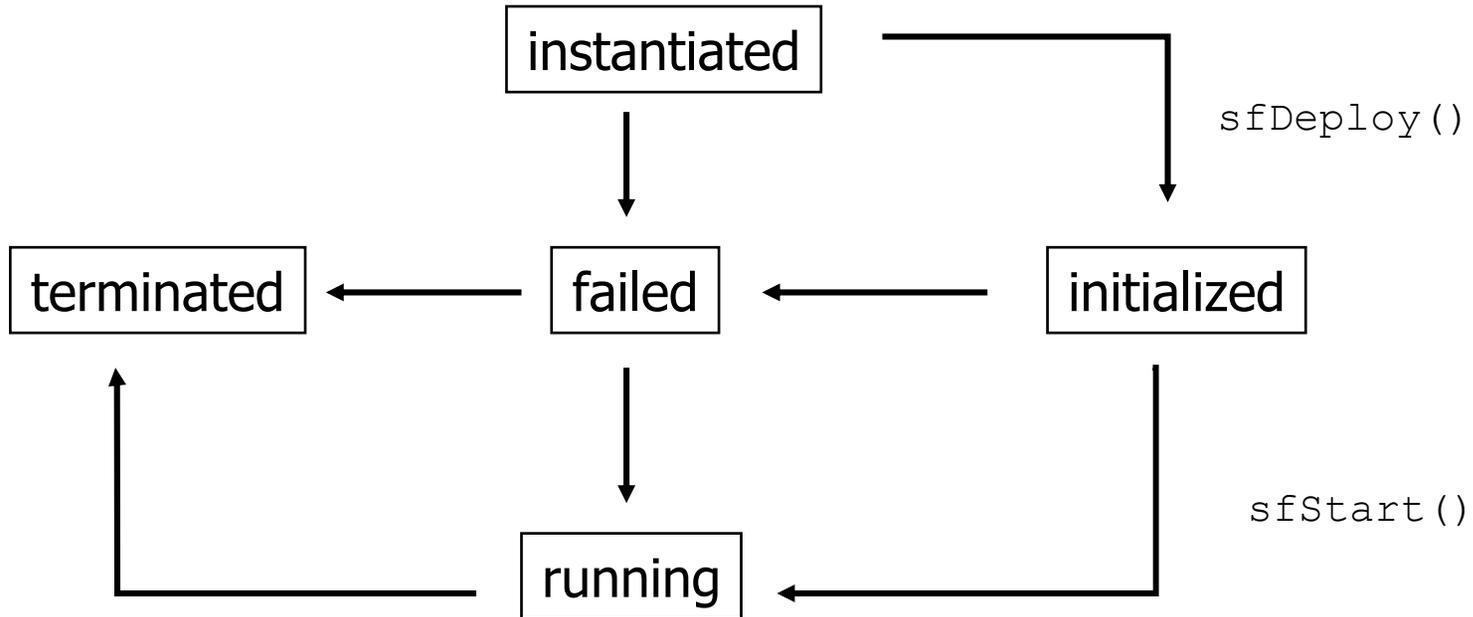

Component model

component = single Java object that implements a specific API

```
myComponent extends {  
    sfClass "cern.ch...."; ← component class  
  
    sfProcessHost "...";  
    sfProcessName "..."; ← component location  
  
    val_1 42;  
}
```

lifecycle:

`sfTerminateWith(TerminationRecord)`

Component model

Additional features:

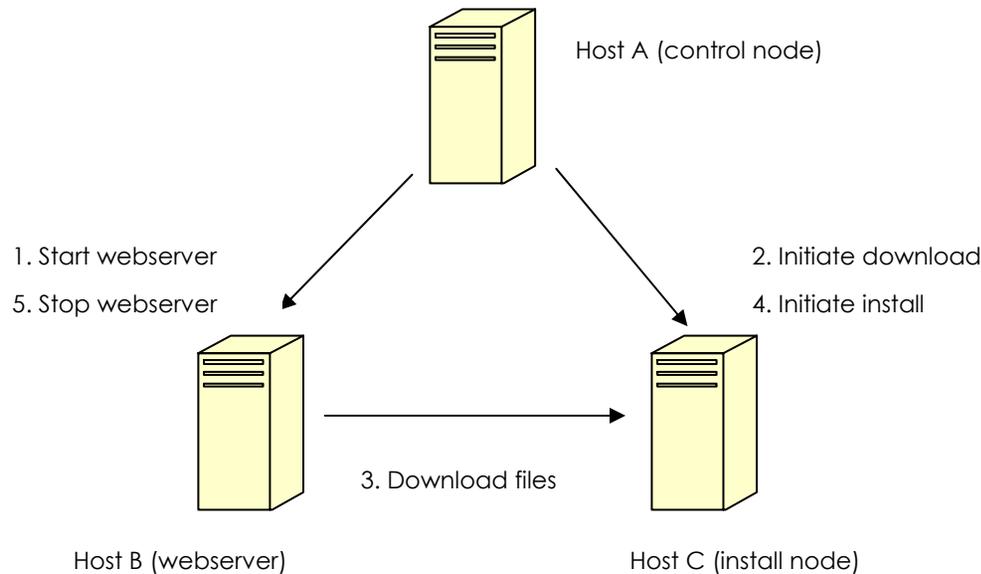

- **Workflow:** Sequence, Parallel, Timeout, During, Retry, Try, Delay
- **Event Framework:** OnEvent, EventSend, EventCounter
- **Execute OS commands:** StartCmd, StartAtt, StopCmd, WorkDir, EnvProperties,...
- **Service Discovery (SLP)**

Runtime system

- **Implemented in Java**
- **RMI for communication**
- **SF daemon on every host; may deploy subprocesses**
- **Security via PKI: classes and configuration descriptions only loaded from signed jar's, RMI calls tunneled over SSL, each node has a certificate**

SF deployment at openlab

3 IA64 hosts
SmartFrog 2.0 beta
RH AW 2.1
JDK 1.4.2

Tested:

- Workflow
- OS commands
- Own Java classes

Not yet tested:

- Security
- Event handling

- **Combine LCFG and SmartFrog: demo of of a robust printing service with an OGSA interface. (details to be presented at LISA 03)**

A first SF resume

- **Easy to install**
- **Seems to be a mature product**
- **So far only an old beta version is available (some bugs, insufficient documentation)**
- **Good support from hp Bristol**
- **It is a – yet empty – framework (considerable programming effort would be necessary for more complicated applications)**
- **Java expertise necessary**
