Formula «mc_Bu2X-B2psiX_2a»

Learning Factors Export

Time	Train Score	Test Score
0	0.0	0.0
1000	0.45	0.40
2000	0.48	0.43
3000	0.50	0.45
4000	0.52	0.46

Analysis complexity

Case: $\tau \rightarrow 3\mu$ (LHCb)

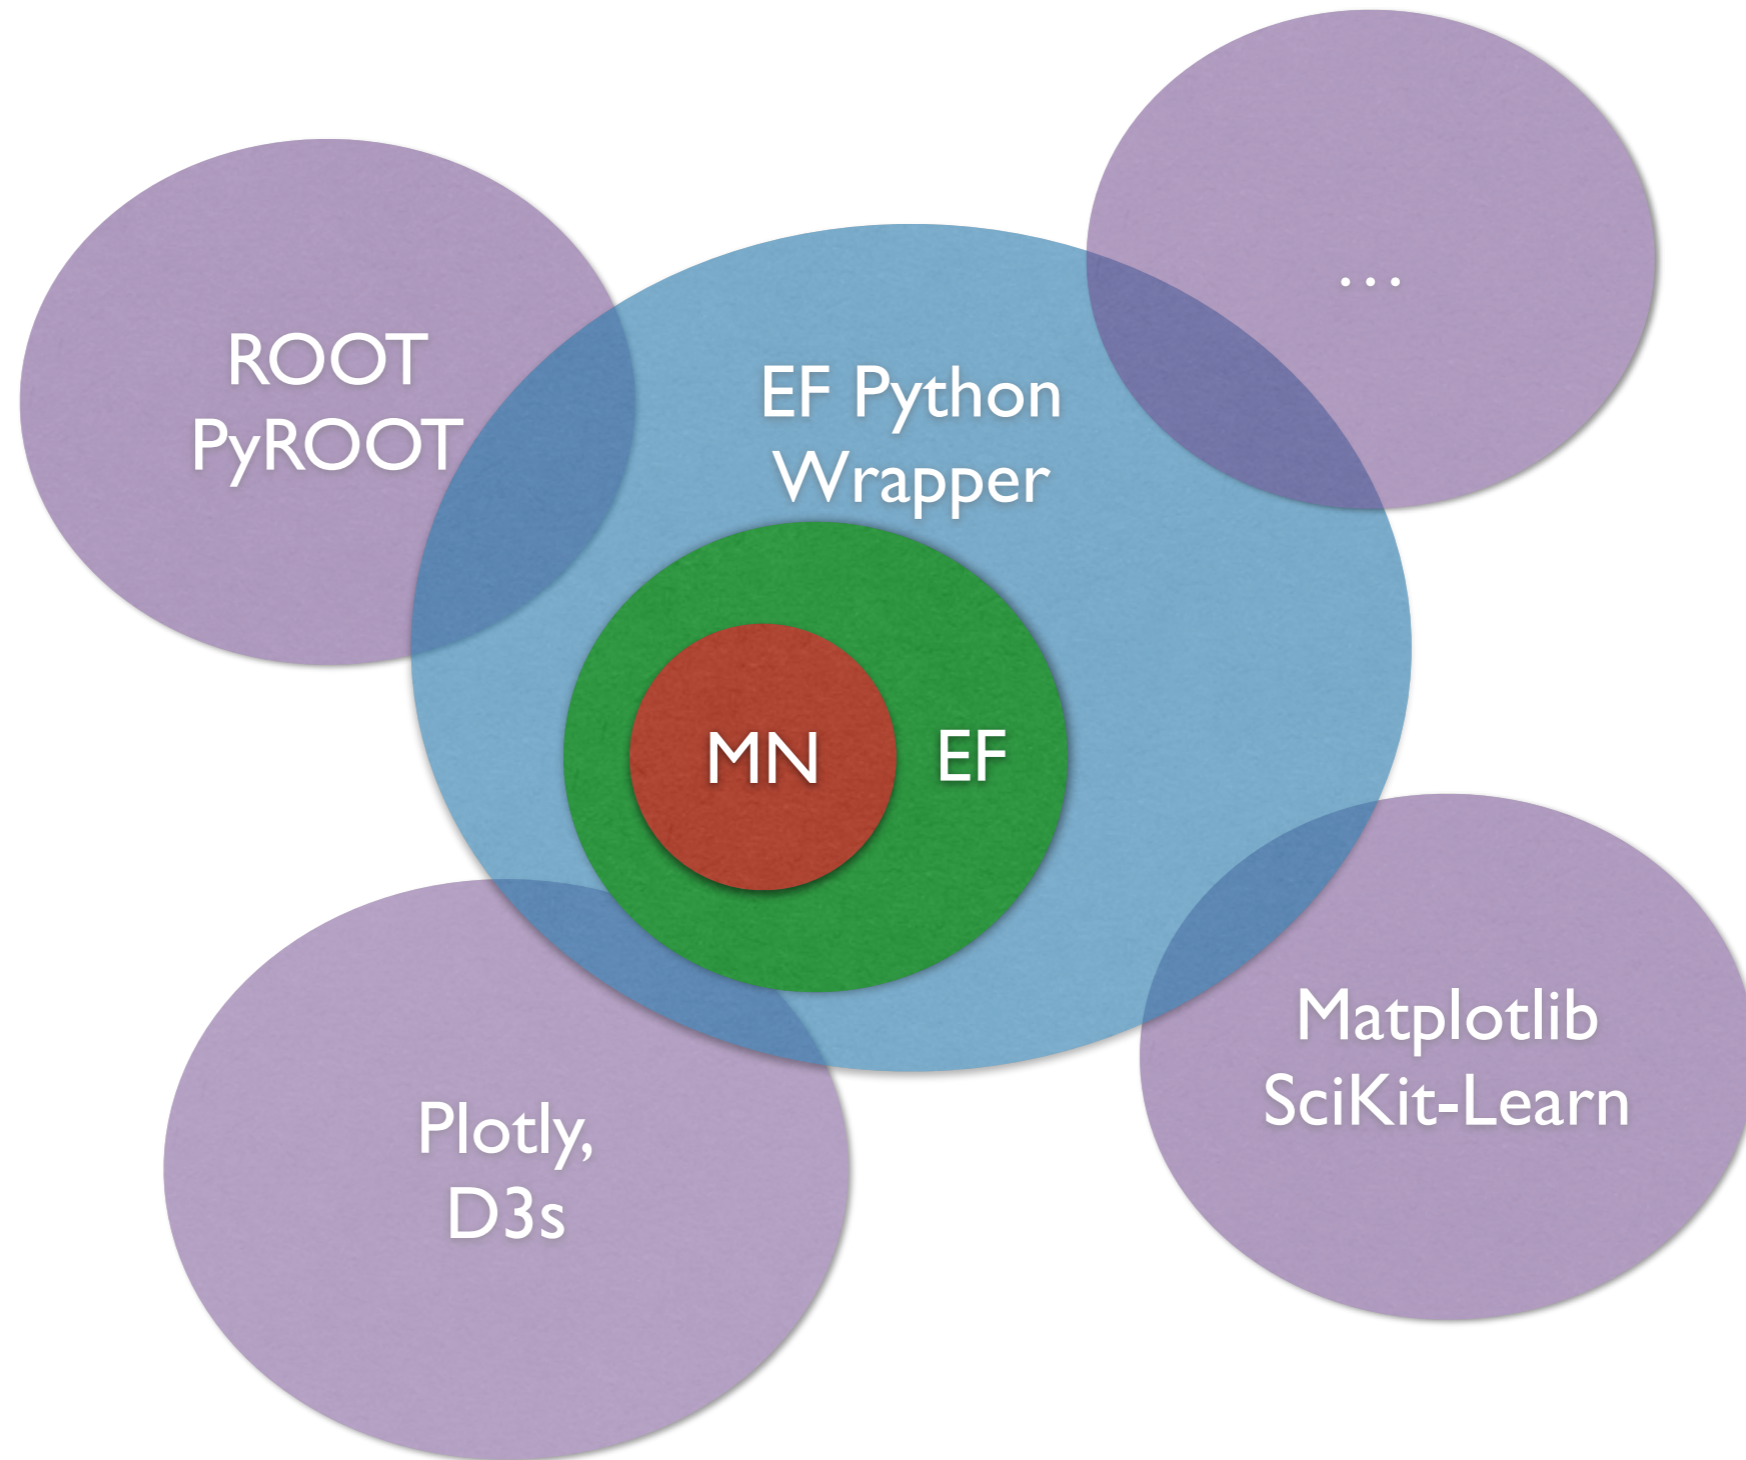

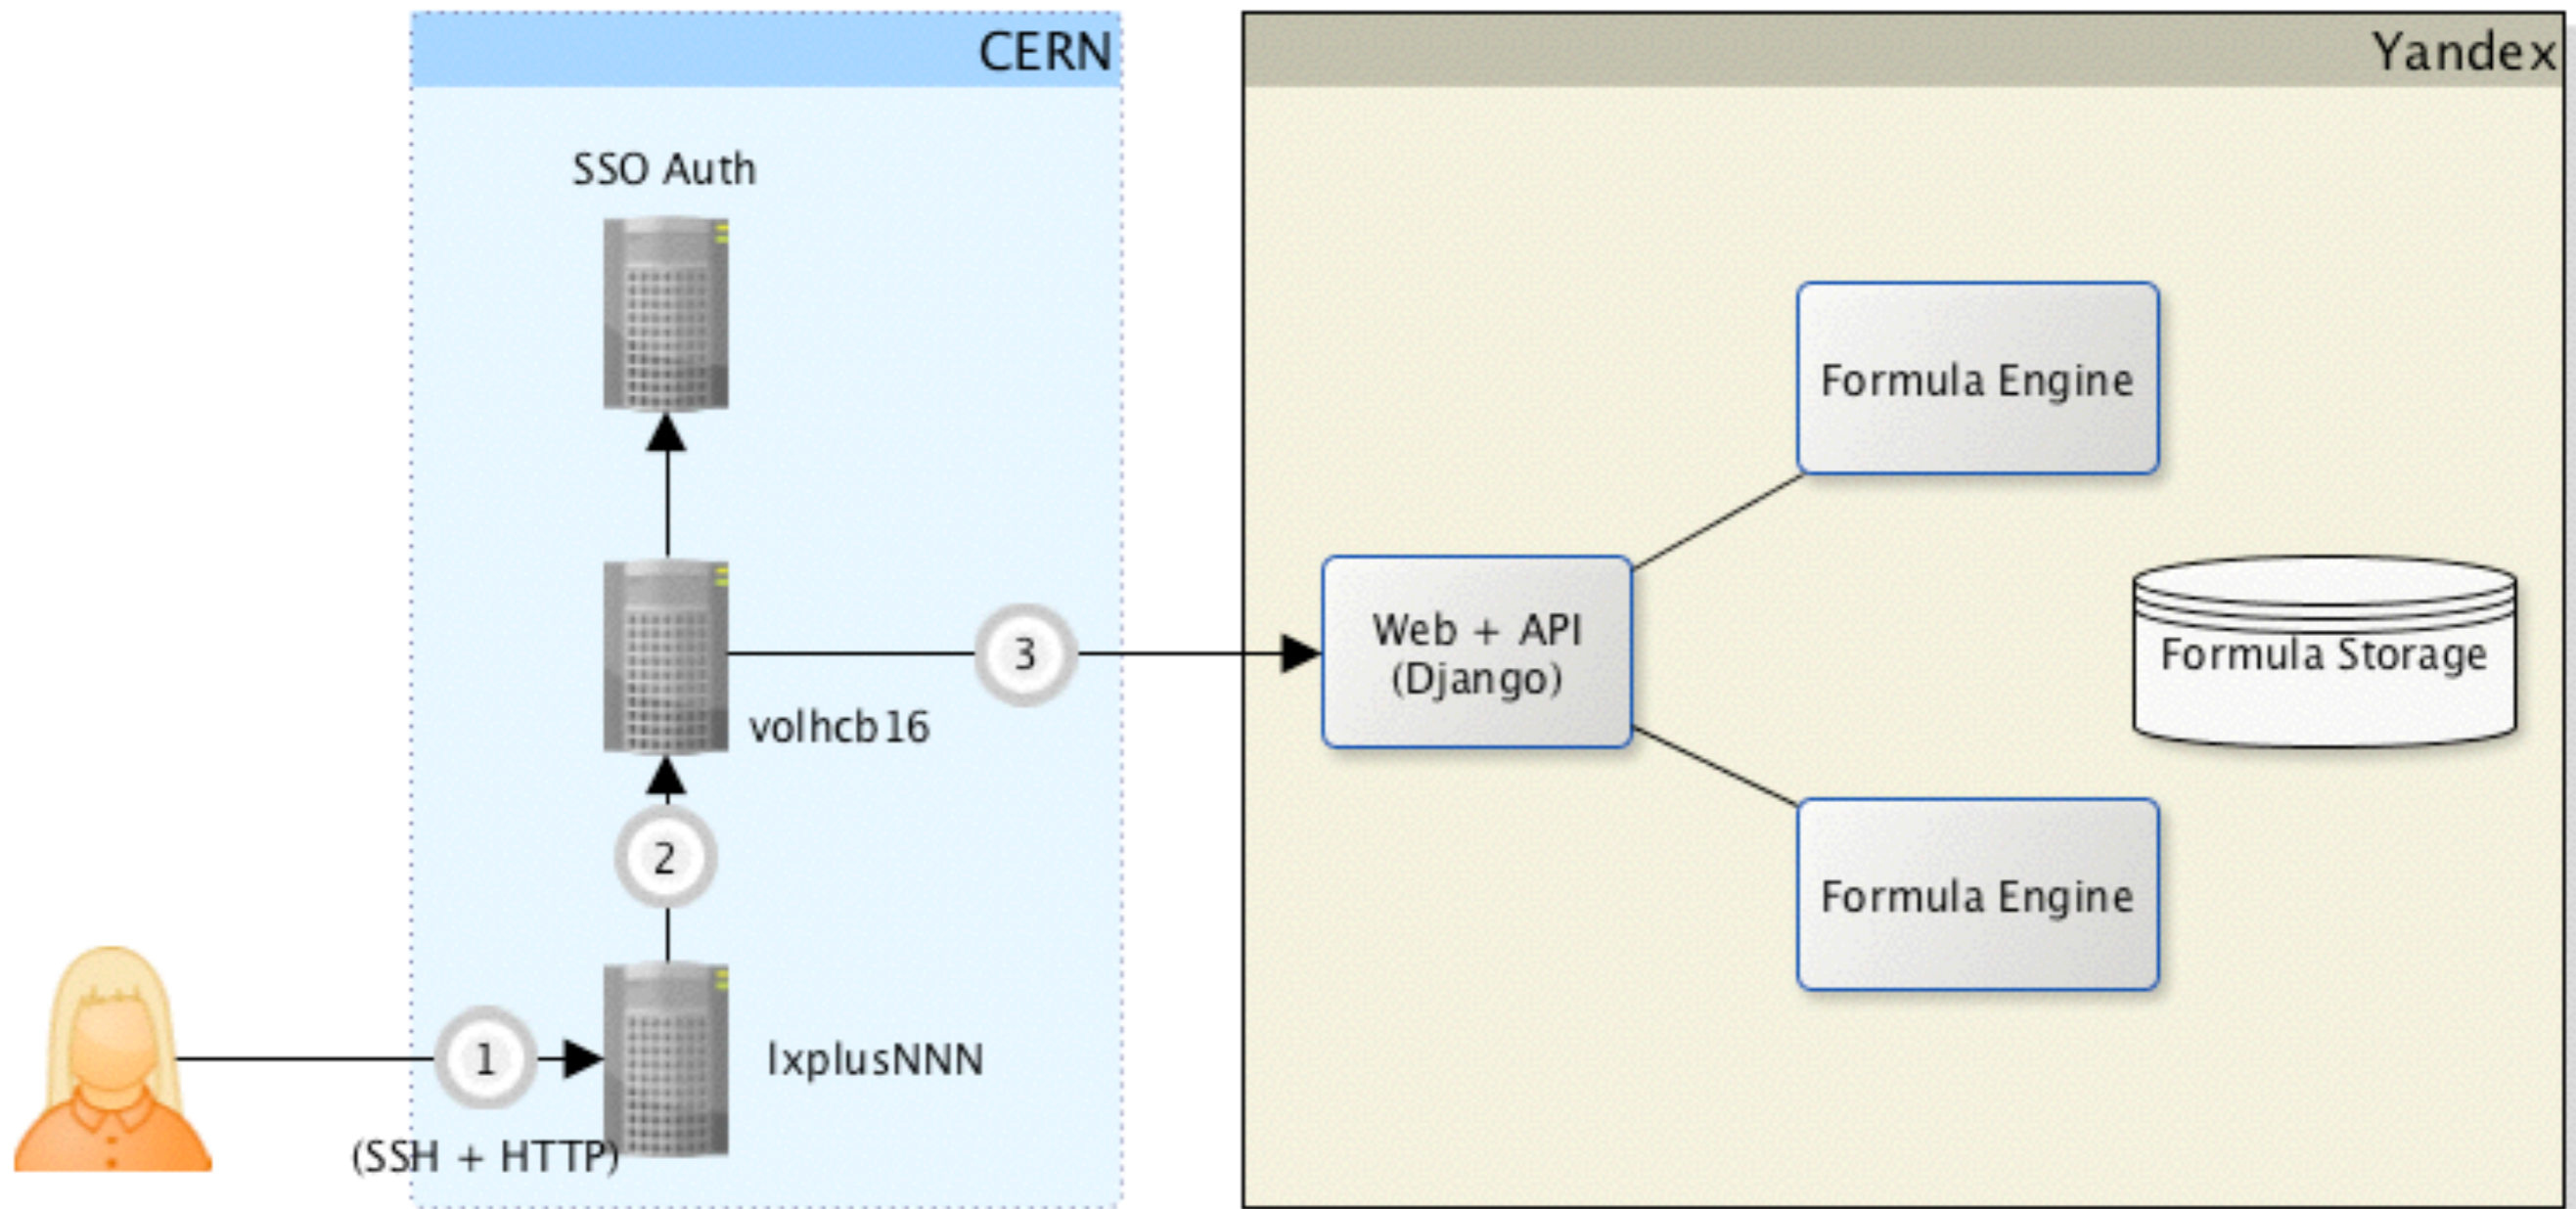

Repeat count: 10^2 10^2 10^3 10^2 10^2 10^2

Trained models: ~ 1500

Requires dedicated framework!

Landscape

EventFilter IPython wrapper howto:
<http://bit.ly/1ktUS4e>

HowTo setup

- Prerequisites
 - SSH client, lxplus account and webbrowser with internet connection
- Running Event Filter in IPython Notebook
 - login to lxplus with port forwarding:

```
ssh -L 8888:localhost:8888 lxplus.cern.ch
```
 - create environment:

```
git clone https://:@git.cern.ch/kerberos/event_filter_tutorial  
cd event_filter_tutorial
```
 - run

```
./run_filter_tutorial.sh
```
 - open URL `http://127.0.0.1:8888/` in your browser.
- Inside IPython Notebook Dashboard
....

HowTo outline

- > Introduction into IPython
- > Event Filter
- > TMVA
- > Model Comparison
- > SciKit-Learn classifiers
- > uBoost
- > other ...

Conclusion

- › EventFilter development is based on real analysis needs
- › Prototype for a broader Framework
- › Open-source, supposed to be fun
- › Welcome to join! (cases? wrappers?)
